A
DISCOVERY
OF A
New World,

OR,
A DISCOURSE Tending
to prove, that 'tis Probable
there may be another Ha-
bitable WORLD in the
MOON.

With a Discourse Concerning the Pro-
bability of a Passage thither. Unto
which is Added, A Discourse Con-
cerning a *New Planet*, Tending to
prove, That 'tis Probable Our
Earth is one of the *Planets*.

In Two Parts.

By John Wilkins, late Lord Bishop
of Chester.

The Fourth Edition Corrected and Amended.

L O N D O N,

Printed by T. M. & J. A. for John Gillibrand
at the Golden-Ball in St. Pauls Church-
Yard. MDC LXXXIV.

THE
EPISTLE
TO THE
READER.

I*F amongst thy Leisure Hours, thou canst spare any for the Perusal of this Discourse, and dost look to find somewhat in it which may serve for thy Information and Benefit: let me then Advise thee to come unto it with an equal Mind, not swayed by Prejudice, but Indiffe-*

The Epistle to the Reader.

rently resolved, to Assent unto that Truth which upon Deliberation shall seem most Probable unto thy Reason, and then I doubt not, but either thou wilt agree with me in this Assertion, or at least not think it to be as far from Truth, as it is from common Opinion.

Two Cautions there are which I would willingly Admonish thee of in the Beginning.

1. That thou shouldst not here look to find any Exact, Accurate Treatise, since this Discourse was but the Fruit of some Lighter Studies, and those too Hudled up in a short time, being first thought of and finished in the space of some few Weeks, and therefore you cannot in Reason Expect,

The Epistle to the Reader.

Expect, that it should be so Polished, as Perhaps, the Subject would Require, or the Leisure of the Author might have done it,

2. To remember that I Promise only Probable Arguments for the Proof of this Opinion, and therefore you must not look that every Consequence, should be of an Undeniable Dependance, or that the Truth of each Argument should be Measured by its Necessity. I grant that some Astronomical appearances may Possibly be Solved otherwise than here they are. But the thing I aim at is this, that Probably they may so be Solved, as I have here set them down: Which, if it be Granted (as

The Epistle to the Reader.

I think it must) then I doubt not, but the Indifferent Reader will find some Satisfaction in the main thing that is to be Proved.

Many Ancient Philosophers of the better Note, have formerly Defended this Assertion, which I have here laid down; and it were to be Wished, that some of us would more Apply our Endeavours unto the Examination of these Old Opinions, which though they have for a long time lien Neglected by others, yet in them may you find many Truths well worthy your Pains and Observation. 'Tis a false Conceit for us to think, that amongst the Ancient Variety and search of Opinions, the best hath still Prevailed.

Time

The Epistle to the Reader.

Time (saith the Learned Vocabularum) seems to be of the Nature of a River or Stream, which Carrieth down to us that which is Light or Blown up, but Sinketh that which is Weighty and Solid.

It is my Desire that by the Occasion of this Discourse, I may Raise up some more Active Spirit to a Search after other hidden and unknown Truths. Since it must needs be a great Impediment unto the Growth of Sciences, for Men still so to Plod on upon beaten Principles, as to be afraid of Entertaining any thing that may seem to Contradict them. An unwillingness to take such things into Examination, is one of those Errors of Learning in these times
Observed

The Epistle to the Reader.
Observed by the judicious Verulam. Questionless, there are many secret Truths, which the Ancients have passed over, that are yet left to make some of our Age Famous for their Discovery.

If by this Occasion I may Provoke any Reader to an Attempt of this Nature, I shall think my self Happy, and this Work Successful,

• Farewell.

The

The Propositions that are proved in this Discourse.

PROPOSITION I.

That the strangeness of this Opinion is no Sufficient reason why it should be Rejected, because other certain Truths have been formerly esteemed ridiculous, and great Absurdities entertained by common consent: By way of Preface.

PROP. II.

That a Plurality of Worlds does not Contradict any Principle of Reason or Faith.

Prop.

PROP. III.

That the Heavens do not consist of any such pure matter which can Priviledge them from the like change and Corruption, as these Inferiour Bodies are liable unto.

PROP. IV.

That the Moon is a Solid, Compacted, Opacous Body.

PROP. V.

That the Moon hath not any Light of her own.

PROP. VI.

That there is a World in the Moon, hath been the direct Opinion of many Ancient, with some Modern Mathematicians, and may probably be deduced from the Tenents of others.

Prop.

PROP. VII.

That those Spots and brighter Parts, which by our Sight may be distinguished in the Moon, do shew the difference betwixt the Sea and Land in that other World.

PROP. VIII.

That the Spots represents the Sea; and the brighter Parts the Land.

PROP. IX.

That there are high Mountains, deep Vallies, and spacious plains in the Body of the Moon.

PROP. X.

That there is an Atmo-sphæra, or an Orb of gross Vaporious Air, immediately encompassing the Body of the Moon.

PROP. XI.

That as their World is our Moon, so our World is their Moon.

Prop.

PROP. XII.

That 'tis probable there may be such Meteors belonging to that World in the Moon, as there are with us.

PROP. XIII.

That 'tis probable there may be Inhabitants in this other World; but of what kind they are, is uncertain.

PROP. XIV.

That 'tis possible for some of our Posterity to find out a conveyance to this other World, and if there be Inhabitants there, to have Commerce with them.

(I)

The first Book.

That the

MOON

May be a

WORLD.

The First Proposition,
by way of Preface.

That the strangeness of this Opinion is no Sufficient reason why it should be rejected, because other certain Truths have been formerly esteemed ridiculous, and great Absurdities entertained by Common Consent.

There is an Earnestness and hungering after Novelty, which doth still adhere unto all our Natures, and it is part of that Primitive Image, that wide Extent and infinite Capacity at first Created in the Heart of Man. For this,

B

since

That the Moon may be a World.

since its depravation in *Adam*, perceiving it self altogether Emptied of any good, doth now catch after every new Thing, conceiving that possibly it may find Satisfaction among some of its fellow Creatures. But our Enemy the Devil (who strives still to pervert our gifts, and beat us with our own Weapons) hath so contriv'd it, that any Truth doth now seem Distastful for that very Reason, for which Errour is entertain'd : Novelty. For let but some upstart Heresie be set abroad, and presently there are some out of a curious Humour ; others, as if they watched an occasion of singularity, will take it up for Canonical, and make it part of their Creed and Profession ; whereas Solitary Truth cannot any-where find so ready Entertainment ; but the same Novelty which is esteemed the Commendation of Errour, and makes that acceptable, is counted the fault of Truth, and causes that to be Rejected:

How did the Incredulous World gaze at *Columbus* ; when he promised to discover another part of the Earth, and he could not for a long time, by his Confidence, or Arguments, Induce any of the Christian Princes, either to assent unto his Opinion, or go to the charges of an Experiment ? Now if he, who had such good grounds for his Assertion, could find no better Entertainment among the Wiser sort, and upper end of the World ; 'tis not likely then that this Opinion which I now deliver, shall

re-

That the Moon may be a World.

receive any thing from the Men of these Days, especially our Vulgar Wits, but Misbeleif or Dislike.

It hath always been the unhappiness of new Truths in Philosophy, to be derided by those that are Ignorant of the causes of things, and rejected by others, whose perverseness ties them to the contrary Opinion, Men whose Envious pride will not allow any new thing for Truth, which they themselves were not the first Inventors of. So that I may justly expect to be accused of a Pragmatical Ignorance, and bold Ostentation ; especially since for this Opinion, *Xenophanes*, a Man whose Authority was able to add some Credit to his assertion, could not escape the like Censure from others. For *Natales Comes* speaking of that Philosopher, and this his Opinion, saith thus, *Nonnulli ne nihil scisse videantur, ali-* Mytholog.
qua nova monstra in Philosophiam introducunt, lib. 3. c. 17.
ut alienus rei inventores fuisse appareant.

" Some there are, who lest they might seem
" to know nothing, will bring up mon-
" strous absurdities in Philosophy, that so
" afterward they may be famed for the In-
" vention of somewhat. The same Au-
" thor doth also in another place accuse *A-*
naxagoras of Folly for the same Opinion.
Est enim non ignobilis gradus stultitiæ, vel si Lib. 7. c. 1.
nescias quid dicas, tamen velle de rebus pro-
positis hanc vel illam partem stabilire. " 'Tis
" none of the worst kinds of Folly, boldly

B 2

" to

That the Moon may be a World.

"to affirm one side or other when a Man knows not what to say.

If these Men were thus censur'd, I may justly then expect to be derided by most, and to be beleived by few or none; especially since this Opinion seems to carry in it so much strangeness, and Contradiction to the general consent of others. But however, I am resolv'd that this shall not be any discouragement, since I know that it is not Common Opinion that can either add or detract from the Truth. For,

1. Other Truths have been formerly esteem'd altogether as ridiculous as this can be.

2. Gross absurdities have been Entertain'd by general Opinion.

I shall give an instance of each, that so I may the better prepare the Reader to consider things Without a prejudice, when he shall see that the Common Opposition against this which I affirm, cannot any way derogate from its Truth.

1. Other Truths have been formerly accounted as ridiculous as this. I shall specify that of the Antipodes, which have been denied; and laugh'd at by many wise Men and great Scholars, such as were Herodotus, Chrysostom, Austin, Lactantius, the Venerable Bede, Lucretius the Poet, Procopius, and the Voluminous Abulensis, together with all those Fathers or other Authors who denied the roundness of the Heavens. Herodotus counted it so horrible an absurdity, that he

*Vid. Joseph:
Acasto de
nat. novi
Orbis lib.
1. cap. 1.*

That the Moon may be a World.

could not forbear laughing to think of it.

Τελὸς δὲ ὁρῶν γῆς περὶ ὅδους γεγενημένος, πολλὰς ἡδὲ
καὶ ἀνὰ νότον ἔχοντες ἐξηγησάμενον οἱ Ὀικιστὲς
ῥιόντες γράφουσιν, πείετ' ἅπαντες γὰρ εἶσαν κυκλωτέρας
αὐτὰς τὸν οὐρανόν. "I cannot choose but laugh,
" (saith he) to see so many Men Venture
" to describe the Earths compass, relating
" those things that are without all Sense,
" as that the Sea flows about the World,
" & that the Earth it self is round as an Orb.
But this great Ignorance is not so much to be admired in him, as in those Learned Men of later times, when all Sciences began to Flourish in the World. Such were St. Chrysostome, who in his 14 Homily upon the Epistle to the Hebrews, does make a challenge to any Man that shall dare to defend that the Heavens are Round, and not rather as a Tent. Thus likewise St. Austin, *De civit. Dei. lib. 16. cap. 9.* who Censures that Relation of the Antipodes to be an incredible Fable; and with him agrees the Eloquent Lactantius, *Quid Instituit illi qui esse contrarios vestigiis nostris Antipodes putant? num aliquid loquuntur? aut est quispi-*
am tam ineptus qui credat esse homines, quorum
vestigia sunt superiora quam capita? aut ibi
quæ apud nos jacent inversa pendere? fruges
& arbores deorsum versus crescere, pluvias &
nives, & grandinem sursum versus cadere in
terram? & miratur aliquis hortos pensiles inter
septem mira narrari, quum Philosophi, & a-
grois & maria, & urbes & Montes pensiles
faciunt, &c. "What (saith he) are they
" that think there are Antipodes, such as

"walk with their Feet against ours? do
 "they speak any likelihood? or is there
 "any one so foolish as to beleive that there
 "are Men whose Heels are higher than
 "their Heads? that things which with us
 "do lie on the ground, do hang there?
 "that the Plants and Trees grow down-
 "wards, that the Hail, and Rain, and
 "Snow fall upwards to the Earth? and
 "do we admire the hanging Orchards a-
 "mongst the seven Wonders, whereas here
 "the Philosphers have made the Field
 "and Seas, the Cities and Mountains
 "hanging? What shall we think (saith he
 in *Plutarch*) that Men do cling to that
 place like Worms, or hang by their Claws
 as Cats? Or if we suppose a Man a little
 beyond the Center: to be digging with a
 Spade; is it likely (as it must be accord-
 ing to this Opinion) that the Earth which
 he loosened, should of it self ascend up-
 wards? or else suppose two Men with their
 middles about the Center, the Feet of the
 one being placed where the Head of the o-
 ther is, and so two other Men cross them,
 yet all these Men thus situated according
 to this Opinion should stand upright, and
 many other such gross consequences would
 follow (saith he) which a false Imagina-
 tion is not able to fancy as possible. Upon
 which considerations, *Bede* also denies the
 being of any Antipodes, *Neque enim Anti-*
temperum, podarum ullatenus est Fabulis accomodandus
Cap. 32. assensus. "Nor should we any longer as-

sent

"sent to the Fable of Antipodes. So also
Lucretius the Poet speaking of the same Sub-
 ject, says,

Sed vanus stolidis hæc omnia finxerit
Errour.

De nat. ve-
rum, Lib 1.

That some idle fancy feigned these, for
 Fools to beleive. Of this opinion was *Pro-*
copius Gazæus, but he was perswaded to *Coment. in*
 it by another kind of Reason; for he thought *1. Cap. Gen.*
 that all the Earth under us was sunk in the
 Water, according to the saying of the *Psalmist*. *Psalm. 24. 2.*
He hath founded the Earth upon the
Seas; and therefore he accounted it not
Inhabited by any. Nay, *Toftatus* a Man of
 later Years, and General Learning, doth
 also confidently deny that there are any
 such Antipodes, though the Reason which
 he urges for it, be not so absurd as the for- *Coment. in*
 mer; For the Apostles, saith he, travelled *1. Genes.*
 through the whole habitable World, but
 they never passed the Equinoctial; and if
 you answer that they are said to go through
 all the Earth, because they went through
 all the known World, he replies, that this
 is not sufficient, since Christ would have all *1 Tim. 2. 4.*
 Men to be saved, and come to the know-
 ledg of his Truth, and therefore 'tis requisite
 that they should have Travelled thither
 also, if there had been any Inhabitants;
 especially since he did expressly command
 them to go and Teach all Nations, and
 Preach the Gospel through the whole World,

Mat. 28. 16 and therefore he thinks, that as there are no Men, so neither are there Seas, or Rivers, or any other conveniency for Habitation. 'Tis commonly related of one *Virgilius*, that he was Excommunicated and Condemned for a Heretick by *Zachary* Bishop of *Rome*, because he was not of the same Opinion. But *Baronius* says, it was because he thought there was another Habitable World within ours. However, you may well enough discern in these examples, how confident many of these great Scholars were in so gross an Errour, how unlikely, what an Incredible thing it seemed to them, that there should be any Antipodes; and yet now this Truth is as certain and plain, as Sense or Demonstration can make it. This then which I now deliver, is not to be rejected, though it may seem to contradict the common Opinion.

2. Gross absurdities have been entertained by general consent. I might instance in many remarkable examples, but I will only speak of the supposed Labour of the Moon in her Eclipses, because this is nearest to the cheif matter in Hand, and was received as a common Opinion amongst many of the Ancients, Insomuch that from hence they stiled Eclipses by the name of *πάθη* Passions, or in the phrase of the Poets,

Solis

Solis lunæq; labores.

And therefore *Plutarch* speaking of a Lunar Eclipse, relates, that at such times 'twas a custom amongst the *Romans* (the most Civil and Learned People in the World) to Sound Brass Instruments, and hold great Torches toward the Heaven. *τῶν δὲ Ῥωμαίων Πάθη* (ὡπερ ὅτιν ἐνομισμῶν) χαλκῆ τε πατόρις ἀνακα-
μιλ. λυμένων πρῶς αὐτῆς καὶ πυρὸς πολλὰ δαλοῖς καὶ δακτύλῳ ἀνιχόντων πρὸς τὴν ἑσπέρην. For by this means they supposed the Moon was much eased in her Labours; and therefore *Ovid* calls such loud Instruments the Auxiliaries or helps of the Moon,

*Metam.
Lib. 4.*

Cum frustra resonant æra auxiliaria Lunæ.

And therefore the Satyrist too, describing a loud Scold, says, She was able to make noise enough to deliver the labouring Moon.

Una laboranti poterit succurrere Lunæ.

*Juvon.
Sat. 6.*

Now the reason of all this their Cerimony, was, because they feared the World would fall asleep, when one of its eyes began to winck, and therefore they would do what they could by loud Sounds to rouse it from its drowiness, and keep it awake, by bright torches, to bestow that light upon it which it began to lose.

Some

Some of them thought hereby to keep the Moon in her Orb, whereas otherwise she would have fallen down upon the Earth, and the World would have lost one of its Lights; for the credulous People beleived, that Inchanters and Witches could bring the Moon down, which made *Virgil* say,

Cantus & de caelo possunt deducere Lunam.

And those Wizards knowing the times of her Eclipses. would then threaten to shew their skill, by pulling her out of her Orb. So that when the silly multitude saw that she began to look red, they presently feared they should lose the benefit of her Light, and therefore made a great noise that she might not hear the sound of those Charms, which would otherwise bring her down; and this is rendred for a reason of this custom by *Pliny* and *Propertius*:

Nat. Hist.

*Lib. 2. c. 12: Cantus & si curru lunam deducere tentant,
Et facerent, si non æra repulsa sonent.*

Plutarch gives another reason of it, and he says, 'tis because they would hasten the Moon out of the dark shade wherein she was involv'd, that so she might bring away the Souls of those Saints that inhabit within her, which cry out by reason they are then deprived of their wonted Happiness, and cannot hear the Musick of the Spheres, but

but are forced to behold the torments and wailing of those Damned Souls which are represented to them as they are Tortured in the Region of the Air. But whether this or what ever else was the meaning of this Superstition, yet certainly 'twas a very ridiculous custom, and bewrayed a great ignorance of those ancient times; especially since it was not only received by the vulgar, such as were Men of less Note and Learning. but beleived also by the more Famous and Wiser sort, such as were those great Poets, *Stesichorus* and *Pindar*. And not only amongst the more sottish Heathens, who might account that Planner to be one of their Gods; but the Primitive Christians also were in this kind guilty, which made Saint *Ambrose* so tartly to rebuke those of his time, when he said, *Tum turbatur carminibus Globus Lunæ, quando calicibus turbantur & oculi.* "When your Heads are troubled with Cups, then you think the Moon to be troubled with Charms."

And for this reason also did *Maximus* a Bishop; write a Homily against it, wherein he shewed the absurdity of that Foolish Superstition. I remember that *Ludovicus Vives* relates a more ridiculous story of a People that imprisoned an Ass for drincking up the Moon, whose Image appearing in the Water, was covered with a Cloud as the Ass was drinking, for which the poor Beast was afterward brought to the Bar to receive a Sentence according to his deserts,

*Turinens.
Episc.*

deferts, where the grave Senate being set to examin the matter, one of the Counsell (perhaps wiser than the rest) rises up, and out of his deep judgment thinks it not fit that their Town should lose its Moon, but that rather the Ais should be cut up, and that taken out of him; which Sentence being approved by the rest of those Politicians, as the subtillest way for the conclusion of the matter, was accordingly performed. But whether this Tale were true or no, I will not question, however, there is absurdity enough in that former Custom of the Ancients, That may confirm the Truth to be proved, and plainly declare the Insufficiency of common opinion to add true Worth or Estimation unto any thing. So that from that which I have said, may be gathered thus much.

1. That a new Truth may seem absurd and impossible, not only to the Vulgar, but to those also who are otherwise, Wise Men and Excellent Schollars; and hence it will follow, that every new thing which seems to oppose common Principles, is not presently to be rejected, but rather to be pry'd into with a diligent enquiry, since there are many things which are yet hid from us, and reserv'd for future Discovery.
2. That it is not the Commonness of an opinion that can priviledge it for a truth; the wrong way is sometime a well beaten Path, whereas the right way (especially

ally to hidden truths) may be less trodden and more Obscure.

True indeed, the strangeness of this Opinion will detract much from its Credit; but yet we should know that nothing is in it self strange, since every Natural Effect has an Equal dependance upon its Cause, and with the like necessity doth follow from it; so that 'tis our Ignorance which makes things appear so; and hence it comes to pass, that many more Evident Truths seem incredible to such who know not the causes of things: you may as soon perswade some Country Peasants, that the Moon is made of Green-Cheese (as we say) as that 'tis bigger than his Cart-Wheel, since both seem equally to contradict his sight, and he has not reason enough to lead him farther than his Senses. Nay suppose (saith *Plutarch*) a Philosopher should be Educated in such a Secret place, where he might not see either Sea or River, and afterwards should be brought out where one might shew him the great Ocean, telling him the quality of that Water, that it is brackish, Salt, and not Potable, and yet there were many vast Creatures of all Forms Living in it, which makes use of the Water as we do of the Air, questionless he would laugh at all this, as being Monstrous lies, and Fables, without any Colour of Truth. Just so will this Truth, which I now deliver, appear unto others; because we never Dreamt of any such matter as a World in the Moon; because

bceause the State of that place hath as yet been vailed from our knowledg, therefore we can scarcely assent to any such matter. Things are very hardly received which are altogether strange to our Thoughts and our Senfes. The Soul may with less difficulty be brought to beleive any absurdity, when as it has formerly been acquainted with some Colours and Probabilities for it; but when a new, and an unheard of Truth shall come before it, though it have good Grounds and Reasons, yet the understanding is afraid of it as a stranger, and dares not admit it into his belief, without a great deal of Reluctancy and Trial. And besides, things that are not manifested to the Senfes, are not assented unto without some Labour of Mind, some Travail and discourse of the understanding; and many lazy Souls had rather quietly repose themselves in an easie Errour, than take Pains to search out the Truth. The strangeness then of this Opinion which I now deliver, will be a great hindrance to its belief, but this is not to be respected by reason it cannot be helped. I have stood the longer in the Preface, because that prejudice which the meer Title of the Book may beget, cannot easily be removed without a great deal of preparation, and I could not tell otherwise how to Rectifie the Thoughts of the Reader for an Impartial Survey of the following Discourse.

I must needs confess, though I had often
thought

thought with my self that it was possible there might be a World in the Moon, yet it seemed such an unacount Opinion, that I never durst discover it, for Fear of being counted singular, and ridiculous; but afterward having read *Plutarch*, *Gallileus*, *Keplar*, with some others, and finding many of mine own Thoughts confirmed by such strong Authority, I then concluded that it was not only possible there might be, but probable that there was another habitable World in that Planet. In the prosecuting of this Assertion, I shall first endeavour to clear the way from such doubts as may hinder the speed or ease of farther progress; and because the Suppositions imply'd in this Opinion, may seem to Contradict the Principles of Reason or Faith, it will be requisite that I first remove this Scruple, shewing the conformity of them to both these, and proving those Truths that may make way for the Rest, which I shall labour to perform in the Second, Third, Fourth, and Fifth Chapters, and then proceed to conform such Propositions, which do more directly belong to the main point in Hand.

PROP. II.

PROP. II.

That a Plurality of Worlds doth not contradict any Principle of Reason or Faith.

TIS reported of *Aristotle*, that when he saw the Books of *Moses*, he commended them for such a Majestick stile, as might become a God, but withal, he censured that manner of Writing to be very unfitting for a Philosopher: because there was nothing proved in them, but matters were delivered, as if they would rather command, than perswade Belief. And 'tis observed that he sets down nothing himself, but he confirms it by the strongest Reason that may be found, there being scarce an Argument of force for any Subject in Philosophy, which may not be picked out of his Writings; and therefore 'tis likely, if there were in Reason a necessity of one only World, that he would have found out some such necessary proof as might confirm it: Especially since he Labours for it so much in two whole Chapters. But now all the Arguments which he himself urges in this Subject, are very weak, and far enough from having in them any convincing Power. Therefore 'tis likely that a Plurality of Worlds doth not contradict any

De Caelo
l. i. c. 8. 9.

any Principle of reason. However, I will set down the two chief of his Arguments from his own Works, and from them you may guess the Force of the other.

The First is this, Since every Heavy *Ibid.* Body doth naturally tend downwards, and every Light Body upwards, what a huddling and confusion must there be, if there were two places for Gravity, and two places for Lightness: for it is Probable, that the Earth of that other World would fall down to this Center, and so Mutually the Air and Fire here ascend to those Regions in the other, which must needs much derogate from the Providence of Nature, and cause a great Disorder in his Works. But *ratio hac est minima firma*, (*said Zanchy*) And if you well consider the nature of Gravity, you will plainly see there is no Ground to fear any such Confusion; for Heaviness is nothing else but such a quality as causes a Propension in its Subject to tend downwards towards its own Center; so that for some of that Earth to come hither, would not be said a Fall, but an Ascension, since it moved from its own Place, and this would be Impossible (*said Ruvo*) because against Nature, and therefore no more to be feared than the falling of the Heavens.

If you reply, that then according to this, there must be more Centers of Gravity than one; I answer, 'Tis very Probable there are, nor can we well Conceive, what

De operi-
bus Dei.
part. 2. lib.

C

what

what any Peice of the Moon would do being severd from the rest in the free and open Air; but only return unto it again.

Metaphys.
l. 12 c. 8.
Diog. Laer.
lib. 3.

Another argument he had from his Master Plato, that there is but one World, because there is but one first Mover, God.

Infirma etiam est hæc ratio (saith Zanchy) and we may justly deny the Consequence, since a Plurality of Worlds doth not take away the Unity of the first Mover. *Ut enim forma substantialis, sic primum efficiens apparentem solum modo multiplicatum induit per signatum materiam* (saith a Country-Man of ours,) As the Substantial form, so the Efficient cause hath only an appearing Multiplicity from its Particular Matter. You may see this point more Largely Handled and these Arguments more Fully answered by Plutarch in his Book (why Oracles are silent) and Jacob Carpentarius in his Comment on *Alecinous*.

Nic. Hill de
Philosop.
Epic. par-
tic. 379.

But our opposites the Interpreters themselves, (who too often do *jurare in verba magistri*) will grant that there is not any Strength in these Consequences, and certainly then such weak Arguments could not convince that Wise Philosopher, who in his other Opinions was wont to be Swayed by the Strength and Power of Reason: wherefore I should rather think that he had some by-respect, which made him first assent to this Opinion, and afterwards strive to Prove it. Perhaps it was because

he

he feared to Displease his Scholar *Alexander*, of whom 'tis related that he Wept to hear a Disputation of another World, since he had not then attained the Monarchy of this; his restless wide Heart would have Esteemed this Globe of Earth not big enough for him, if there had been another, which made the Strayrist say of him,

Plutarch.
de tranq.
anim.

Æstuas infelix angusto limite mundi. Juvenal.

"That he did Vex himself, and Sweat in his desires, as being Pend up in a narrow Room, when he was Confin'd but to one World. Before he thought to Seat himself next the Gods: but now when he had done his best, he must be content with some Equal, or perhaps Superiour Kings.

It may be, that *Aristotle* was moved to this Opinion, that he might thereby take from *Alexander* the occasion of this Fear and Discontent; or else, perhaps *Aristotel* himself was as loth to hold the Possibility of a World which he could not discover, as *Alexander* was to hear of one which he could not Conquer. 'Tis likely that some such by-respect moved him to this Opinion, since the Arguments he urges for it, are confest by his Zealous followers and Commentators, to be very Slight and Frivolous, and they themselves grant, what I am now to Prove, that there is not any Evidence in the Light of Natural Reason, which

can sufficiently manifest that there is but one World.

But however some may Object, would it not be Inconvenient and Dangerous to admit of such Opinions that do destroy those Principles of *Aristotle*, which all the World hath so long Followed?

*Apologia
pro Ga-
lileo.*

This question is much controverted by some of the *Romish* Divines; *Campanella* hath Writ a Treatise in defence of it, in whom you may see many things worth the Reading and Notice.

To it I answer, That this Position in Philosophy, doth not bring any Inconvenience to the rest, since 'tis not *Aristotle*, but Truth that should be the rule of our Opinions, and if they be not both found together, we may say to him, as he said to his Master *Plato*, ἀφ' οὗ καὶ ὁ δὲ τὴν φιλοσοφίαν, ὅταν αἰσχυρῶν ἢ ἀλίσθεν. "Though *Plato* were his Friend, "yet he would rather adhere to Truth, "than him.

*Ethic. l. i.
c. 6.*

I must needs grant, that we are all much beholden to the industry of the Ancient Philosophers, and more especially to *Aristotle*, for the greater part of our Learning; but yet 'tis not Ingratitude to speak against him, when he opposeth Truth; for then many of the Fathers would be very Guilty, especially *Justin*, who hath writ a Treatise purposely against him.

But suppose this opinion were false, yet 'tis not against the Faith, and so it may serve for the better confirmation of that which

which is True; the Sparks of Errour, being forced out by Opposition, as the Sparks of Fire by the striking of the Flint and Steel. But suppose too, that it were Heretical, and against the Faith, yet may it be admitted with the same Priviledg as *Aristotle*, from whom many more dangerous Opinions have proceeded: as, That the World is Eternal; That God cannot have while to look after these Inferiour things; That after Death there is no Reward or Punishment, and such like Blasphemies, which strike directly at the Fundamentals of our Religion.

So that it is justly to be wondered, why some should be so Superstitious in these Days, as to stick closer unto him, than unto Scripture, as if his Philosophy were the only Foundation of all Divine Truths.

Upon these Grounds, both *St. Vincentius*, and *Serafinus de firmo*, (as I have seen them quoted) think, That *Aristotle* was the Viol of Gods Wrath, which was poured out upon the Waters of Wisdom, by the Third Angel; But for my part, I think the World is much beholden to him for all its Sciences. But yet 'twere a shame for these latter Ages to Rest our Selves meerly upon the Labours of our Fore-fathers, as if they had informed us of all things to be known; and when we are set upon their Shoulders, not to see further than they themselves did. 'Twere a Superstitious, a lazy Opinion, to think *Aristotles* works the Bounds and Limits

Rev. 16. 4.

mites of all Humane Invention, beyond which there could be no possibility of reaching. Certainly there are yet many things left to discovery, and it cannot be any inconvenience for us, to maintain a new Truth, or Rectifie an Ancient Errour.

But the position (say some) is directly against Scripture, for

1. *Moses* tells us but of one World, and his History of the Creation had been very Imperfect, if God had made another.

2. Saint *John* speaking of Gods works, says, he made the World in the singular Number, and therefore there is but one : 'tis the Argument of *Aquinas*, and he thinks that none will oppose it, but such who with *Democritus* esteem some blind Chance, and not any wise Providence to be the Framer of all things.

Part I Q.
47. Art. 3.

3. The Opinion of more Worlds has in Ancient times been accounted a Heresie, and *Baronius* affirms, that for this very Reason *Virgilius* was cast out of his Bishoprick, and Excommunicated from the Church.

Annal.

Eccel. A.D.

743.

Ibid.

4. A Fourth Argument there is urged by *Aquinas*; if there be more Worlds than one, then they must either be of the same, or of a divers Nature; but they are not of the same kind; for this were needless, and would Argue an Improvidence, since one would have no more perfection than the other; not of divers kinds, for then one of them could not be called the World

or

or Universe, since it did not contain Universal perfection. I have cited this Argument, because it is so much stood upon by *Julius De Pha-*
Cesar la Galla, one that has purposely writ a Treatise against this Opinion which I now deliver; but the Dilemma is so blunt that it cannot cut on either side, and the Consequences so weak, that I dare truit them without an Answer, And (by the way) you may see this later Author in that place, where he endeavours to prove a necessity of one World, doth leave the chief matter in Hand, and take much needless pains to dispute against *Democritus*, who thought, that the World was made by the casual concurrence of *Atoms* in a great *Vacuum*. It should seem, that either his cause, or his skill was weak, or else he would have ventured upon a stronger Adversary. These Arguments which I have set down, are the chiefest which I have met with against this Subject, and yet the best of these hath not force enough to endanger the Truth that I have delivered.

nom.

Luna.

Unto the two first, it may be answered, that the Negative Authority of Scripture, is not prevalent in those things which are not the Fundamentals of Religion.

But you'll reply, though it do not necessarily conclude, yet 'tis probable, if there had been another world, we should have had some notice of it in Scripture.

I answer, 'tis as probable that the Scripture

ture should have informed us of the Planets, they being very remarkable parts of the Creation; and yet neither *Moses*, nor *Job*, nor the *Psalms*, (the places most frequent in Astronomical Observations) nor any other Scripture mention any of them, but the Sun and Moon. Because the difference betwixt them and the other Stars, was known only to those who were Learned Men, and had skill in *Astronomy*. As for that expression in *Job* כוכבי בקר the Stars of the Morning, it is in the plural Number, and therefore cannot properly be applied

Job. 38. 7. to *Venus*. And for that in *Isaiah* דגל, 'tis confessed to be a word of obscure Interpretation, and therefore is but by guess Translated in that Sense. It being a true and common Rule, that *Hebraei rei sideralis minime curioſi cœlestium nominum penuria laborant*. The Jews being but little skilled in Astronomy, their Language does want proper Expressions for the Heavenly Bodies, and therefore they are fane sometimes to attribute the same Name unto divers Constellations.

Keplar. in-videntius apud eos qui capiunt. Which do so Evidently set forth the Wisdom of the Creator: And therefore you must know, that 'tis besides the Scope of the Old Testament

or

or the New, to discover any thing unto us concerning the Secrets of Philosophy; 'tis not his intent in the New Testament, since we cannot conceive how it might any way belong either to the Historical, Exegetical, or Prophetical parts of it; nor is it his intent in the Old Testament, as is well Observed by our Country-Man, Master *WRIGHT*, *Non Moſis aut Prophetarum inſtitutum fuiſſe videtur Mathematicas aliquas aut Phyſicas ſubtilitates promulgare, ſed ad vulgi captum & loquendi morem, quemadmodum nutrices infantulis ſolent, ſeſe accommodare.* " 'Tis not the endeavour of *Moses* or the Prophets to discover any Mathematical or Philosophical Subtilties, but rather " to Accommodate themselves to Vulgar Capacities, and Ordinary Speech, as Nurses are wont to use their Infants. True indeed, *Moses* is there to handle the History of the Creation. But 'tis certain (saith *Calvin*) that his purpose is to Treat only of the visible form of the World, and those parts of it, which might be most easily understood by the Ignorant and Ruder sort of People, and therefore we are not thence to expect the discovery of any Natural Secret. *Artes reconditas aliunde diſcat qui volet; hic Spiritus Dei omnes ſimul ſine exceptione docere voluit.* As for more hidden Arts, they must be looked for else-where; the Holy Ghost did here intend to instruct all without exception. And therefore 'tis Observed, That *Moses* does not any where meddle

In Epist. ad Gilbert.

Calvinus
1 Gen.

meddle with such matters as were very hard to be conceived; for being to Inform the Common People, as well as others, he does it after a Vulgar way, as it is Commonly Noted, declaring the Original, chiefly of those things which are Obvious to the Sense, and being silent of other things, which then could not well be apprehended. And therefore *Pererius* proposing the question, why the Creation of Plants and Herbs is mentioned, but not of Metals and Minerals?

Answers. *Quia istarum rerum generatio est vulgo occulta & ignota.* Because these things are not so commonly known as the other; and he adds, *Moses non omnia, sed manifesta omnibus enarranda suscepit.* *Moses* did not intend to relate unto us the beginnings of all things, but those only which were most Evident unto all Men. And therefore too,

Part 1. 2. Aquinas observes, that he writes nothing of the Air, because that being invisible, the People knew not whether there were any such Body or no. And for this very Reason,

St. Jerom also thinks, that there is nothing expreit concerning the Creation of Angels, because the Rude and Ignorant Vulgar were not so capable of apprehending their Natures. And yet notwithstanding, these are as remarkable parts of the Creation, and as fit to be known as another World. And therefore the Holy Ghost too, uses such Vulgar Expressions, which set things forth rather as they appear, than as they

they are, as when he calls the Moon *one of the greater Lights*, whereas 'tis the least that we can see in the whole Heavens. So afterwards speaking of the great Rain which drowned the World; he says, *The Windows of Heaven were opened*, because it seemed to come with that Violence, as if it were poured out from Windows in the Firmament.

And in Reference to this, a drowth is described in Sundry other * places, by the *Heavens being shut up*. So that the Phrases which the Holy Ghost uses, concerning these things, are not to be understood in a Literal Sense; but rather as Vulgar Expressions; and this Rule is set down by Saint *Austin*, where speaking concerning that in the Psalm, *who stretched the Earth upon the Waters*, he Notes, that when the Words of Scripture shall seem to contradict common Sense or Experience, there, are they to be understood in a qualified Sence, and not according to the Letter. And 'tis observed, that for want of this Rule, some of the Ancients have fastened strange Absurdities upon the words of the Scripture. So Saint *Ambrose* esteemed it a Heresie to think that the Sun and Stars were not very Hot, as being against the Words of Scripture, *Psalm* 19. 6. where the *Psalmist* says, that there is nothing that is hid from the Heat of the Sun. So others there are that would prove the Heavens not to be Round, out of that place, *Psalm* 104. 2. *He stretched out the*

Com. int. 1. Gen. *Heavens like a Curtain.* So Procopius also was of Opinion, that the Earth was Founded upon the Waters; Nay, he made it part of his Faith, proving it out of *Psal. 24. 2.* *He hath Founded the Earth upon the Seas, and Established it upon the Floods.* These and such like Absurdities have followed, when Men look for the Grounds of Philosophy in the Words of Scripture. So that, from what hath been said, I may conclude, that the silence of Scripture, concerning any other World, is not Sufficient Argument to prove that there is none. Thus for the Two first Arguments.

Unto the Third, I may Answer, That this very Example is quoted by others, to shew the Ignorance of those Primitive Times, who did sometimes condemn what they did not understand, and have often censur'd the Lawful and undoubted Parts of Mathematicks for Heretical, because they themselves could not perceive a Reason of it. And therefore their Practice, in this particular, is no Sufficient Testimony against us.

But Lastly, I answer to all the above named Objections, That the Term (*World*) may be taken in a double Sense, more Generally, for the whole Universe, as it Implies in it the Elementary and Æthereal Bodies, the Stars and the Earth. Secondly, more Particularly, for an Inferiour World consisting of Elements.

Now the main Drift of all these Arguments

is to confute a Plurality of Worlds in the first Sense, and if there were any such, it might, Perhaps, seem strange, that *Moses*, or *St. John* should either not Know, or not mention its Creation. And *Virgilius* was Condemned for this Opinion, because he held, *quod sit alius mundus sub terrâ, aliisque Sol & Luna*, (as *Baronius*,) That within our Globe of Earth, there was another World, another Sun and Moon, and so he might seem to Exclude this from the Number of the other Creatures.

But now there is no such Danger in this Opinion, which is here delivered, since this World is said to be in the Moon, whose Creation is Particularly Express'd.

So that in the first Sense, I yeild, that there is but one World, which is all that the Arguments do Prove; but Understand it in the second Sense, and so I Affirm, there may be more; nor do any of the above named Objections Prove the Contrary.

Neither can this Opinion derogate from the Divine Wisdom, (as *Aquinas* thinks) but rather Advance it, shewing a *Compendium* of Providence, that could make the same Body a World, and a Moon; a World for Habitation, and a Moon for the Use of others, and the Ornament of the whole Frame of Nature. For as the Members of the Body serve not only for the Preservation of themselves; but for the Use and Convenience of the Whole, as the

Qu. 19.
Art. 2.*

Hand Protects the Head as well as saves it Self; so is it in the parts of the Universe, where each one may serve as well for the Conservation of that which is within it, as the Help of others without it.

Mersennus a late Jesuit, Proposing the Question, whether or no the Opinion of more Worlds than one, be Heretical, and against the Faith? He answers it Negatively, because it does not Contradict any Express place of Scripture, or Determination of the Church. And though (saith he) it seems to be a rash Opinion, as being against the Consent of the Fathers; yet, if this Controversie be chiefly Philosophical, then their Authorities are not of such Weight. Unto this it may be added, that the Consent of the Fathers is Prevalent only in such Points as were first Controverted amongst them, and then generally decided one way, and not in such other Particulars as never fell under their Examination and Dispute.

I have now in some Measure, shewed that a Plurality of worlds does not Contradict any Principle of Reason, or place of Scripture, and so cleared the first part of that Supposition which is implied in the Opinion.

It may next be enquired, whether 'tis possible there may be a Globe of Elements in that which we call the Æthereal parts of the Universe; for if this (as it is according to the common Opinion) be Priviledged from

from any Change or Corruption, it will be in vain then to Imagin any Element there, and if we will have another World, we must then seek out some other place for its Situation. The Third Proposition therefore shall be this,

PROP. III.

That the Heavens do not consist of any such Pure matter, which can Priviledg them from the like Change and Corruption, as these Inferiour Bodies are Liable unto.

IT hath been often questioned amongst the Ancient Fathers and Philosophers, what kind of matter that should be, of which the Heavens are Framed. Some think that they consist of a Fifth Substance, distinct from the Four Elements, as *Ari- De Cælo* *Stoile* holds, and with him some of the late *l. 1. c. 2.* School-Men, whose Subtil Brains could not be content to Attribute to those Vast Glorious Bodies but common Materials, and therefore they themselves had rather take Pains to prefer them to some extraordinary Nature; whereas notwithstanding, * *Colleg. communib. de cælo. l. 1. c. 2. q. 6. art. 3.* all the Arguments they could Invent, were not able to Convince a necessity of any such Matter, as is confest by their own * side.

side. It were much to be desired, that these Men had not in other Cases, as well as this, Multiplied things without Necessity, and as if there had not been enough to be known in the Secrets of Nature; have Spun out new Subjects from their own Brains, to find more Work for Future Ages; I shall not mention their Arguments, since 'tis already Confest, that they are none of them of any necessary Consequence: and besides you may see them set down in any of the Books *de Calo*.

But it is the General Consent of the Fathers, and the Opinion of *Lombard*, that the Heavens consist of the same matter with these Sublunary Bodies. *St. Ambrose* is so confident of it, that he esteems the contrary, a Heresie. True indeed, they differ much among themselves, some thinking them to be made of Fire, others of Water, and others of both; but herein they generally agree, that they are all framed of some Element or other. Which *Diomysius Carthusianus* collects from that place in *Genesis*, where the Heavens are mentioned in their Creation, as divided only in distance from the Elementary Bodies, and not as being made of any new Matter. To this purpose others Cite the Derivation of the Hebrew word מים, *quasi* מים *ibi* מים *aqua* or *quasi* מים *ignis* מים *aqua*. Because they are framed out of these Elements. But concerning this, you may see sundry Discourses more at large in *Ludovicus Molina*, *Escobius*

*In Hexam.
lib. 4.*

*Enoch. in
Genes. lib.
10.*

sebius Nivernbergius, with divers others. *In opere 6
dierum. disput. 5.
In lib. de
Mundi
constit.*
The Venerable *Bede* thought the Planets to consist of all the Four Elements; and 'tis likely that the other parts are of an Aereous Substance; as will be shewed afterward, however, I cannot now stand to Recite the Arguments for either; I have only urged these Authorities to countervail *Aristotle*, and the School-Men, and the better to make way for a proof of their Corruptibility.

2 Pet. 3. 12.

The next thing then to be enquired after, is, whether they be of a Corruptible Nature; not whether they can be destroyed by God; for this, Scripture puts out of doubt.

Nor whether or no in a long time they would wear away and grow worse; for from any such Fear they have been lately priviledged. But whether they are capable of such changes and vicissitudes, as this Inferiour World is Lyable unto?

*By Doctor
Hakewill.
Ap. l. lib. 2.*

The two cheif Opinions concerning this, have both Erred in some Extremity, the one side going so far from the other, that they have both gone beyond the Right, whilst *Aristotle* hath opposed the Truth, as well as the Stoicks.

Some of the Ancients have thought, that the Heavenly Bodies have stood in need of Nourishment from the Elements, by which they were continually Fed, and so had divers Alterations by reason of their Food? this is Fathered on *Heraclitus*, followed by that

side. It were much to be desired, that these Men had not in other Cases, as well as this, Multiplied things without Necessity, and as if there had not been enough to be known in the Secrets of Nature, have Spun out new Subjects from their own Brains, to find more Work for Future Ages; I shall not mention their Arguments, since 'tis already Confest, that they are none of them of any necessary Consequence: and besides you may see them set down in any of the Books *de Cælo*.

But it is the General Consent of the Fathers, and the Opinion of *Lombard*, that the Heavens consist of the same matter with these Sublunary Bodies. *St. Ambrose* is so confident of it, that he esteems the contrary, a Heresie. True indeed, they differ much among themselves, some thinking them to be made of Fire, others of Water, and others of both; but herein they generally agree, that they are all framed of some Element or other. By Doctor
Hakerill.
Ap. l. lib. 2.

The two chief Opinions concerning this, have both Erred in some Extremity, the one side going so far from the other, that they have both gone beyond the Right, whilst *Aristotle* hath opposed the Truth, as well as the *Stoicks*.

Some of the Ancients have thought, that the Heavenly Bodies have stood in need of Nourishment from the Elements, by which they were continually Fed, and so had divers Alterations by reason of their Food: this is Fathered on *Heraclitus*, followed by

D

that

Plutarch. de plac. philof. l. 2. c. 17. Nat. Hift. l. 2. c. 9. Nat. quæst. lib. 2. c. 5. that great Naturalist *Pliny*, and in general Attributed to all the *Stoicks*. You may see *Seneca* exprefly to this purpose in thefe Words: *Ex illâ alimenta omnibus animabus, omnibus fatis, omnibus ftellis dividunter, hinc profertur quo fufineantur tot Sidera tam exercitata, tam avida per diem, noctemque, ut in opere, ita in paffu.* Speaking of the Earth, he fays, from thence it is that Nourifhment is Divided to all the Living Creatures, the Plants and the Stars; hence were fufained fo many Conftellations, fo Laborious, fo Greedy, both Day and Night, as well in their Feeding as Working. Thus alfo *Lucan* fings,

*Nacron Oceano pasci phœbûmq; polumq;
Credimus.*

1. Apoftel. Unto thefe *Ptolomie* alfo that Learned Egyptian feemed to agree, when he affirms that the Body of the Moon is Moifter, and Cooler than any of the other Planets, by reafon of the Earthly Vapours that are exhaled unto it. You fee thefe Ancients thought the Heavens to be fo far from this Imagined Incorruptibility, that rather like the weakeft Bodys they stood in need of fome Continual Nourifhment, without which they could not Subfift.

*De calo.
l. 1. c. 3.*

But *Aristotle* and his Followers were fo far from this, that they thought thefe Glorious Bodies could not Contain within them any fuch Principles as might make them

them Lyable to the leaft Change or Corruption; and their Chief Reafon was, becaufe we could not in fo long a Space Difcern any alteration amongst them; But unto this I Anfwer.

1. Suppofing we could not, yet would it not hence Follow that there were none; as he himfelf in Effect doth Confefs in another Place; for Speaking Concerning our knowledge of the Heavens, he fays, *De calo. l. 2. cap. 3:* 'tis very Imperfect and Difficult; by Reafon of the Vast diftance of thefe Bodies from us, and becaufe the Changes which may Happen unto them, are not either Big enough, or Frequent enough to fall within the Apprehenfion and Obfervation of our Senses: no wonder then if he himfelf be Deceived in his Affertions Concerning thefe Particulars. But yet, in this he Implies, that if a Man were nearer to thefe Heavenly Bodies, he would be a fitter Judge, to decide this Controverfie than himfelf. Now its our Advantage, that by the help of *Galileus* his Glaſs, we are Advanced nearer unto them, and the Heavens are made more Prefent to us than they were before. However, as it is with us where there be many Viciffitudes and Succelfions or things, though *the Earth abideth for Ever*: So likewise may it be amongst the Planets, in which tho there ſhould be divers Alterations, yet they themſelves may ſtill Continue of the ſame Quantity and Light.

D 2

2. Though

for the Confirmation of it, are Briefly these Three.

1. From the Altitude of divers Comets, which have been Observed to be above the Planets, through whose Orbs (if they had been Solid) there would not have been any Passage. To these may be added those Lesser Planets lately discovered about *Jupiter* and *Saturne*, for which Astronomers have not yet Framed any Orbs.

2 From that uncertainty of all Astronomical Observations, which will follow upon the Supposition of such Solid Spheres. For then we should never Discerne any Star but by a Multitude of Refractions, and so Consequently we could not Possibly find their true Situations either in Respect of us, or in Regard of one another. Since what ever the Eye Discerns by a Refracted Beam, it Apprehends to be in some other Place than wherein it is. But now this would be such an Inconvenience, as would quite Subvert the grounds and whole Art of Astronomy, and therefore is by no Means to be Admitted.

Unto this it is commonly Answered, that all those Orbs are Equally Diaphanous, though not of a Continued quantity. We reply, that Supposing they were, yet this cannot hinder them from being the Cause of Refraction, which is Produced as well by the Diversity of Surfaces, as the Different

Different

Different Perspicuity of Bodies. Two Glasses put together, will cause a Divers Refraction from another Single one that is but of Equal Thickness and Perspicuity.

3 From the Different Height of the same Planet at several times. For if According to the Usual Hypothesis, there should be such Distinct, Solid Orbs, then it would be Impossible that the Planets should Intrench upon one anothers Orbs, or that two of them at several Times should be above one another, which notwithstanding hath been Proved to be so by Later Experience. *Tycho* hath Observed, that *Venus* is sometimes nearer than the Sun or *Mercury*, and sometimes farther off than both; which Appearances *Regiomontanus* himself does Acknowledg, and withal, does Confess that they cannot be Reconciled to the common Hypothesis.

But for your Better Satisfaction herein, I shall Refer you to the above Named *Scheiner*, in his *Rosa Ursina*, in whom you may see both Authorities and Reason, very Largely and Distinctly set down for this Opinion. For the better Confirmation of which he adjoyns also some Authentical Epistles of *Fredericus Cæsius Lynceus*, a Noble Prince, written to *Bellarmino*, Containing Divers Reasons to the same Purpose. You may also see the same Truth set down by *Johannes Pena*, in his Preface to *Euclids Opticks*, and *Christoph. Rothmannus*, both who thought the Firma-

D 4

ment

Lib. 4. p. 11
2. cap. 7. 25
30.

De stella. ment to be only Air: and though the
 15. 72. 1. 1. Noble Tycho do Dispute against them, yet
 c. 9. he himself holds; *Quod propius ad veritatis
 penetralia accedit hac opinio, quam Aristotelica
 vulgariter approbata, quae calum pluribus
 repletur. Atque impervius orbibus citra rem
 replevit.* That this Opinion comes nearer
 "to the Truth, than the Common one of
 "Aristotle, which hath to no purpose filled
 "the Heavens with such real and Imper-
 "vious Orbs.

2. There is no Element of Fire, which
 must be held with this Opinion here De-
 livered; for if we Suppose a World in the
 Moon, then it will follow, that the Sphear of
 Fire, either is not there were 'tis usually
 placed in the Concavity of his Orb, or
 else that there is no such thing at all, which
 is most Probable, since there are not any such
 Solid Orbs, that by their swift Motion
 might Heat and Enkindle the adjoining
 Air, which is Imagined to be the Reason
 of that Element. The Arguments that
 are Commonly Urged to this Purpose, are
 these.

1. That which was before alledged Con-
 cerning the Refractions which will be
 caused by a Different Medium. For if the
 Matter of the Heavens be of one Thick-
 ness, and the Element of Fire another, and
 the upper Region of Air Distinct from
 both these, and the Lower Region severel
 from all the rest, there will then be such
 a Multiplicity of Refractions, as must
 Necessarily

Necessarily Destroy the Certainty of all
 Astronomical Observations. All which In-
 conveniences might be Avoided, by sup-
 posing (as we do) that there is only one
 Orb of Vaporous Air which Encompasses
 our Earth, all the rest being *Aethereal* and
 of the same Perspicuity.

2. The Scituation of this Element does
 no way agree with *Aristotles* own Prin-
 ciples, or that common Providence of Na-
 ture, which we may Discern in Ordinary
 Matters: For if the Heavens be without
 all Elementary Qualities, as is usually sup-
 posed, then it would be a very Incongruous
 thing for the Element of Fire to be placed
 immediattly next unto it: Since the Heat
 of this is the most Powerful and Vigorous
 Quality that is amongst all the rest; And
 Nature in her other Works, does not join
 Extreame, but by something of a middle
 Disposition. So in the very Frame of our
 Bodies, the Bones which are of a Hard
 Substance, and the Flesh of a Soft, are
 not joined together but by the Inter-
 cession of Membranes and Grissels, such
 as being of a Middle Nature may fitly
 come Betwixt.

3. 'Tis not Conceivable for what Use
 or Benefit there should be any such Ele-
 ment in that Place, and Certain it is,
 that Nature does not do any thing in
 Vain.

4. Betwixt two Extreame there can be
 but one Medium, and therefore between
 those

those two Opposite Elements of Earth and Water, it may seem more Convenient to place only the Ayr, which shall Partake of Middle Qualities different from both.

- 5 Fire does not seem so Properly and Directly to be Opposed to any thing as Ice, and if the one be not an Element, why should the other?

If you Object that the Fire which we Commonly use, does always tend upwards. I answer, This cannot Prove that there is a Natural place for such an Element, since our Adversaries themselves do grant that *culinary* and *elementary* Fire are of different kinds. The one does Burne, Shine, and Corrupt its Subjects; the other disagrees from it in all these respects. And therefore from the Ascent of the one, we cannot Properly Infer the Being or Situation of the other.

But for your farther Satisfaction herein, you may Peruse *Cardan*; *Johannes Pena*, that Learned Frenchman, the Noble *Tycho*, with divers others who have purposely Handled this Proposition.

- 3 I might add a Third, *viz*: that there is no Musick of the Spheres; for if they be not Solid, how can their Motion cause any such Sound as is Conceived? I do the rather Meddle with this, because *Plutarch* Speaks as if a Man might very Conveniently hear that Harmony, if he were an Inhabitant in the Moon. But I guess that he said this out of Incogitancy, and did not well Consider those Necessary Consequence

quences which Depend upon his Opinion. However the World would have no great Loss in being Deprived of this Musick, unless at sometimes we had the Priviledg to hear it: Then indeed *Philo* the Jew thinks it would save us the Charges of *De somniis*, Dyet, and we might Live at an easy Rate by Feeding at the Ear only, and Receiving no other nourishment, and for this very Reason (says he) was *Moses* Enabled to tarry Forty Days and Forty Nights in the Mount without Eating any thing, because he there heard the Melody of the Heavens. --*Risum teneatis*. I know this Musick hath had great Patrons, both Sacred and Prophane Authors, such as *Ambrose*, *Bede*, *Boetius*, *Anselme*, *Plato*, *Cicero*, and others; but because it is not now, I think, Affirmed by any, I shall not therefore bestow either Pains or Time in Arguing against it.

It may suffice that I have only Named these Three last, and for the two more necessary, have referred the Reader to others for Satisfaction. I shall in the next place Proceed to the Nature of the Moons Body, to know whether that be Capable of any such Conditions, as may make it possible to be Inhabited, and what those Qualities are wherein it more nearly Agrees with our Earth.

PROP. IV.

*That the Moon is a Solid, Compacted,
Opacous Body.*

I Shall not need to stand long in the Proof of this Proposition, since it is a Truth already agreed on by the General Consent of the most, and the best Philosophers.

I. It is Solid, in Opposition to Fluid, as the Ayr; for how otherwise could it bear back the Light which it receives from the Sun?

But here it may be Questioned, whether or no the Moon bestow her Light upon us, by the Reflection of the Sun-beams from the Superficies of her Body, or else by her own Illumination? Some there are who Affirm this latter part. So (a)

^a De celo
l. 2. com. 49.

tion. li. 20.
c 4.
c De pha-
nom.
Lime. c. 11.

Averroes: (b) *Celius Rhodiginus*, (c) *Julius Caesar*, &c. And their Reason is because this Light is Discerned in many Places, whereas those Bodies which give Light by Reflexion, can there only be perceived where the Angel of Reflexion is Equal to the Angel of Incidence, and this is only in one Place, as in a Looking-Glass, those Beams which are reflected from it, cannot be Perceived in every place where you may see the Glass, but only

only there where your Eye is placed on the same Line whereon the Beams are Reflected.

But to this I answer, That the Argument will not hold of such Bodies, whose Superficies, is full of Unequal parts and Gibbosities as the Moon is. Wherefore it is as well the more Probable; as the more common Opinion, that her Light Proceeds from both these Causes, from Reflexion and Illumination; nor doth it herein differ from our Earth, since that also hath some Light by Illumination: for how otherwise would the Parts about us in a Sun-shine Day appear so Bright, when as the Rays of Reflexion cannot Enter into our Eye?

For the better Illustration of this, we may Consider the several ways whereby divers Bodies are Enlightened. Either as Water, by admitting the Beams into its Substance; or as Air, and thin Clouds, by Transmitting the Rays quite thorow their Bodies; or as those things that are of an Opacous Nature, and Smooth Superficies, which Reflect the Light only in one Place; or else, as those things which are of an Opacous Nature, and Rudged Superficies, which by a kind of Circumfluous Reflexion, are at the same time Discernable in many Places, as our Earth, and the Moon.

2. It is Compact, and not a Spungey and Porous Substance. But this is Denied by (a) *Diogenes*, (b) *Vitellio*, and (c) *Reinoldus*, and

^{2.}

bac. Theop.
164.

and some others, who held the Moon to be of the same kind of Nature as a Pumice Stone; and this, say they, is the Reason why in the Suns Eclipses there Appears within her a Dusky ruddy Colour, because the Sun Beams being Refracted in passing through the Pores of her Body, must necessarily be Represented under such a Colour.

But I Reply, if this be the Cause of her Redness, then why doth she not appear under the same form when she is about a Sextile Aspect, and the Darkened part of her Body is Discernable? for then also do the same Rays pass through Her, and therefore in all likelyhood should Produce the same Effect; and notwithstanding those Beams are then Diverted from us, that they cannot enter into our Eyes by a straight Line, yet must the Colour still Remain Visible in her Body. And besides, according to this Opinion, the spots would not always be the same, but Divers as the Various distance of the Sun Requires; Again, if the Sun Beams did pass through Her, why then hath she not a Tail (saith Scaliger) as the Comets? why doth she Appear in such an exact Round? and not rather Attended with a Long Flame, since it is meerly this Penetration of the Sun-Beams, that is usually Attributed to be the Cause of Beards in Blazing Stars.

Scaliger
Exercit. 80
sect. 13.

3
Plus de fa-
cie Luna.

3 It is Opacous, not Transparent or Diaphanous like Crystal or Glass, as Empe-
docles

docles thought, who held the Moon to be a Globe of pure Congealed Ayr, like Hail inclosed in a Sphere of Fire; for then,

1. Why does she not always appear in the full? since the Light is Dispersed through all her Body.

2. How can the Interposition of her Body so Darken the Sun, or cause such great Eclipses as have turned Day into Night, that have Discovered the Stars, and Frighted the Birds with such a suddain Darkness, that they fell down upon the Earth, as it is related in divers Histories. And therefore Herodotus telling of an Eclipse which fell in Xerxes time Describes it thus: *ἡ δὲ ἡμέρα ἡν ἡ σελήνη ἐκρύβητο ἐφ' ὅσον ἀπὸ τοῦ ἡλίου*. The Sun leaving his wonted Seat in the Heavens, Vanished away: all which argues such a great Darckness, as could not have been, if her Body had been Perspicuous. Yet some there are who Interpret all these Relations to be Hyberbolical Expressions; and the Noble Tycho thinks it Naturally Impossible that any Eclipse should cause such Darkness, because the Body of the Moon can never Totally cover the Sun. However in this he is singular, all other Astronomers (if I may belive Kepler) being on the Contrary Opinion, by Reason the Diametur of the Moon does for the most part appear Bigger to us than the Diametur of the Sun.

cie Luna:]

Herodotus.
7. c. 37.

Bur

De pha-
nom. Luna
c. II.

But here *Julius Caesar* once more puts in to hinder our Passage. The Moon (saith he) is not altogether Opacous, because 'tis still of the same Nature with the Heavens which are Incapable of total Opacity: and his Reason is, because Perspicuity is an Inseparable Accident of those purer Bodies; and this he thinks must Necessarily be granted; for he Stops there, and Proves no further; but to this I shall Defer an answer, till he hath made up his Argument.

Prop. 9.

In lib. de
animalib.

We may frequently see, that her Body does so Eclipse the Sun, as our Earth doth the Moon. And besides the Mountains that are Observed there, do cast a Dark shadow behind them, as shall be shewed afterwards. Since then the like Interposition of them both, doth Produce the like Effect; they must Necessarily be of the like Natures, that is, alike Opacous, which is the thing to be shewed; and this was the Reason (as the Interpreters guess) why *Aristotle* Affirmed the Moon to be of the Earths Nature, because of their Agreement in Opacity; whereas all the other Elements, save that, are in some measure Perspicuous.

But, the greatest Difference which may seem to make our Earth altogether unlike the Moon, is, because the one is a Bright Body, and hath Light of its own, and the other a Gross, Dark Body, which cannot Shine at all. 'Tis requisite therefore that in the

he next place I clear this doubt, and shew that the Moon hath no more light of her own than our Earth.

Proposition. V.

*That the Moon hath not any Light
of her own.*

TWas the fancy of some of the Jews, and more especially of *Rabbi Simeon*, that the Moon was nothing else but a Contracted Sun, and that both those Planets at their first Creation, were equal both in Light and quantity. For, because God did then call them both great Lights, therefore they inferred that they must be both equal in bigness. But a while after (as the Tradition goes) the Ambitious Moon put up Her Complaint to God against the Sun, shewing that it was not fit there should be two such great Lights in the Heavens; a Monarchy would become the place of Order and Harmony. Upon this, God Commanded Her to contract her self into a Narrower compass; but she being much discontented hereat, replies, What! because I have spoken that which is Reason and Equity, must I therefore be diminish-

*Testatus in
1 Gen.
Hieron. de
Sanctaside.
Hebraeo-
mast. 12. c. 4.*

E ed

ed? This Sentence could not chuse but much trouble Her; and for this Reason was she in great distress and grief for a long space, but that her Sorrow might be some way pacified, God bid her be of good Cheer, because her Priviledges and Charter should be greater than the Suns; he should appear in the Day time only, the both in the Day and Night; but her Melancholly being not satisfied with this, she replied again, That that alas was no benefit; for in the Day time, she should be either not seen, or not noted. Wherefore, God to Comfort Her up, promised, that his People the Israelites should Celebrate all their Feasts and Holy Days by a Computation of her Months; but this being not able to Content Her, she has looked very Melancholly ever since; however she hath still reserved much light of her own.

Others there were, that did think the Moon to be a Round Globe; the one half of whose Body was of a bright Substance, the other half being dark; and the divers Conversions of those sides towards our Eyes, caused the Variety of her appearances: of this Opinion was *Berosus*, as he is cited by (a) *Vitruvius*; and (b) *St. Austin* thought it was probable enough. But this fancy is almost equally absurd with the former, and both of them sound rather like Fables, than Philosophical Truths. You may Commonly see how this latter does Contradict frequent and easie experience;

for

a Lib. 9.
Archite-
cture.
b Narratio
p. 119.
ep. 119.

for 'tis observed, that that spot which is perceived about her middle, when she is in the Encrease, may be discern'd in the same place when she is in the Full: whence it must follow, that the same part which was before darkened, is after enlightened, and that the one part is not always Dark, and the other Light of it self. But enough of this, I would be loth to make an Enemy, that I may afterwards overcome him, or bestow time in Proving that which is already granted, I suppose now, that neither of them hath any Patrons, and therefore need no Confutation.

'Tis agreed upon by all sides, that this Planet receives most of her Light from the Sun; but the cheif controversie is, whether or no she hath any of her own? The greater Multitude affirm this. *Cardan* amongst the rest, is very confident of it, *De Subtil. lib. 4.* and he thinks that if any of us were in the Moon at the time of her greatest Eclipse, *Lunam aspiceremus non secus ac innumeris cereis splendidissimis accensis, atque in eas oculis defixis cæcutiremus*; "Wee should perceive so great a Brightness of her own, that would Blind us with the meer sight, and when she is Enlightened by the Sun, then no Eagles eye (if there were any there) is able to look upon Her. This *Cardan* says, and he doth but say it, without bringing any Proof for its confirmation. However I will set down the Arguments that are usually urged for this

E 2

Opinion,

Opinion, and they are taken either from Scripture, or Reason; from Scripture is urged that Place, 1 Cor. 15. where it is said, *There is one Glory of the Sun, and another Glory of the Moon.* Ulysses Albertus urges that in Math. 24. 20. *ὁ σελήνη ἡ δόξα τοῦ φέγγους αὐτῆς*, *The Moon shall not give her Light*: therefore (says he) she hath some of her own.

But to these we may easily Answer, that the Glory and Light there spoken of, may be said to be hers, though it be derived, as you may see in many other instances.

The Arguments from Reason are taken either.

1. From that Light which is Discerned in her, when there is a total Eclipse of her own Body, or of the Sun.

2. From the Light which is Discerned in the Darker part of her Body, when she is but a little Distant from the Sun.

1. For when there are any total Eclipses, there appears in her Body a great redness, and many times Light enough to cause a remarkable shade, as common Experience doth sufficiently manifest: but this cannot come from the Sun, since at such times either the Earth or her own Body shades her from the Sunbeams; therefore it must proceed from her own Light.

2. Two or three Days after the new Moon,

Moon, we may perceive Light in her whole Body, whereas the Rays of the Sun reflect but upon a small part of that which is Visible; therefore 'tis likely that there is some Light of her own.

In answering to these Objections, I shall first shew, that this Light cannot be her own, and then declare that which is the true Reason of it.

That it is not her own, appears,

1. Because then she would always retain it, but she has been sometimes altogether Invisible, when as notwithstanding some of the fixed Stars of the fourth or fifth Magnitude might easily have been discerned close by her, As it was in the Year 1620.

Keplar. epit. Astron. cop. l. 6. p. 5.

2. This may appear likewise from the Variety of it at divers times; for 'tis commonly Observed that sometimes 'tis of a Brighter, sometimes of a Darker appearance, now Redder, and at another time of a more Dusky colour. The Observation of this variety in divers Eclipses, you may see set down by *Keplar* and many others. But now this could not be, if that Light were her own, that being Constantly the same, and without any Reason of such an alteration: So that thus I may argue.

Opt. Astron. c. 7. num. 3.

If there were any Light proper to the Moon, then would that Planet appear Brightest when she is Eclipsed in her Perige being nearest to the Earth, and so conse-

*De nova
stella. lib. 1.
c. 10.*

quently more Obscure and Dusky when she is in her Apoge or farthest from it ; the Reason is, because the nearer any Enlightened Body comes to the Sight, by so much the more strong are the Species and the better perceived. This sequel is granted by some of our Adversaries, and they are the very Words of Noble Tycho, *Si Luna genuino gauderet lumine, utiq; cum in umbra terræ esset, illud non amitteret, sed ed evidentiùs exereret; omne enim lumen in tenebris, plus splendet cum alio majore fulgore non præpeditur.* If the Moon had any Light of her own, then would she not lose it in the Earths Shadow, but rather shine more Clearly ; since every Light appears greater in the Dark, when it is not hindered by a more Perspicuous Brightness

Reinhold
Comment.
in Purb.
Theor pag.
164.

But now the event falls out clean contrary, (as Observation doth manifest, and our Opposites themselves do grant) the Moon appearing with a more reddish and Clear Light when she is Eclipsed, being in her Apoge or farthest distance, and a more blackish Iron colour when she is in her Perige or nearest to us, therefore she hath not any Light of her own. Nor may we think that the Earths shadow can cloud the proper Light of the Moon from Appearing, or take away any thing from her inherent Brightness; for this were to think a shadow to be a Body, an Opinion altogether misbecoming a Philosopher,

as

as Tycho grants in the fore-cited place, *Nec numbra terræ corporeum quid est, aut densa aliqua substantia, ut Lunæ lumen obtenebrare possit, atque id visui nostro præripere, sed est quædam privatio luminis solaris, ob interpositum opacum corpus terræ.* Nor is the Earths shadow any Corporal thing, or thick substance, that it can cloud the Moons Brightness, or take it away from our Sight ; but it is a meer privation of the Suns Light by Reason of her Interposition of the Earths Opacous Body.

3 If she had any Light of the own, then that would in it self be either such a ruddy Brightness as appears in the Eclipses, or else such a Leaden dusky Light as we see in the Darker parts of her Body, when she is a little past the Conjunction. (That it must be one of these, may follow from the Opposite Arguments) but it is neither of these; therefore she hath none of her own.

1 'Tis not such a ruddy Light as appears in Eclipses; for then why can we not see the like redness, when we may discern the Obscure parts of the Moon?

You will say, perhaps, that then the nearness of that greater Light takes away that Appaerance.

I Reply, this cannot be; for then why does Mars shine with his wonted Redness, when he is near to the Moon? or why cannot her greater Brightness make him appear White as the other Planets? nor

E 5 can

can there be any Reason given why that greater Light would represent her Body under a false Colour.

2. 'Tis not such a dusky leaden Light, as we see in the darker part of her Body, when she is about a Sextile Aspect distant from the Sun; for then why does she appear red in the Eclipses, since meer shade cannot cause such Variety? for 'tis the Nature of darkness by its Opposition, rather to make things appear of a more White and clear Brightness than they are in themselves, Or if it be the shade, yet those parts of the Moon are then in the shade of her Body, and therefore in Reason should have the like Redness. Since then neither of these Lights are hers, it follows

that she hath none of her own. Nor is this a singular Opinion, but it hath had many Learned Patrons; such as *Macrobius*, who being for this quoted of *Rhodiginus*, he calls him *vir reconditissimæ scientiæ*, a Man who knew more than ordinary Philosophers, thus commending the Opinion in the credit of the Author. To him allents the Venerable *Bede*, upon whom the Gloss hath this Comparison. As the Looking-Glass represents not any Image within it self unless it receive some from without; so the Moon hath not any Light, but what is bestowed by the Sun. To these agreed (a) *Albertus Magnus*, (b) *Scaliger*, (c) *Mestlin*, *Keplar*, and more Especially (d) *Malapertius*, whose Words are more p.

to the purpose than others, and therefore I shall set them down as you may find them in his Preface to his Treatise concerning the *Austriaca Sydera*; *Luna*, *Venus*, & *Mercurius*, *terrestres* & *humidæ sunt substantiæ, ideoq; de suo non lucere, sicut nec terrâ*. The Moon, *Venus*, and *Mercury* (saith he) are of an Earthly and moist substance, and therefore have no more Light of her own, then the Earth hath. Nay, some there are, who think, (though without Ground) that all the other Stars do receive that Light, whereby they appear Visible to us, from the Sun: so *Protonie*, (a) *Isidore Hispalensis*, (b) *Albertus Magnus*, and (c) *Bede*; much more then must the Moon shine with a borrowed Light.

Annot. in
Gen. 6.

But enough of this. I have now sufficiently shewed what at the first I Promised, that this Light is not Proper to the Moon. It remains in the next Place, that I tell you the true Reason of it. And here I think 'tis Probable that the Light which appears in the Moon at the Eclipses, is nothing else but the Second species of the Suns Rayes which pass through the shadow unto her Body: and from a mixture of this second Light with the shadow arises that Redness which at such times appears unto us. I may call it *Lumen crepusculinum*, the *Aurora* of the moon, or such a kind of blushing Light, that the Sun causes when he is near his rising, when he bestowes some small Light upon the

the thicker Vapours. Thus we see commonly the Sun being in the Horizon, and the Reflexion growing weak, how his Beams make the Waters appear very Red.

2 King. 3. 22. The Moabites in *Jebozams* time, when they Rose Early in the Morning, and beheld the Waters afar off, mistook them for Blood. *Et causa hujus est quia radius solaris in hoc cap. in Aurora contrahit quondam rubedinem, propter vapores combustos manentes circa superficiem terræ, per quos radii transeunt, & ideo cum repercutiuntur in aqua ad oculos nostros, trahunt secum eundem ruborem, & faciunt apparere locum aquarum, in quo est reperculio, esse rubrum, scilicet Tostatus.* The Reason is, because of his Rayes, which being in the lower Vapours, those do convey an Imperfect mixed Light upon the Waters. Thus the Moon being in the Earths shadow, and the Sun Beams which are round about it, not being able to come Directly unto her Body, yet some second Rayes there are, which passing through the shadow, make her appear in that Ruddy colour: So that she must appear Brightest when she is Eclipsed, being in her Apoge or greatest Distance from us, because then the cone of the Earths shadow is less, and the Refraction is made through a narrower Medium. So on the contrary, she must be Represented under a more Dark and Obscure form when she is Eclipsed, being in her Perige or nearest to the Earth, because then

then she is Involved in a greater shadow, or bigger part of the cone, and so the refraction passing through a greater Medium, the Light must needs be Weaker which doth proceed from it. If you ask now, what the Reason may be of that Light which we Discern in the Darker part of the New Moon? I answer, 'tis Reflected from our Earth, which returns as great a Brightness to that Planer, as it receives from it. This I shall have occasion to Prove afterward.

I have now done with these Propositions which were set down to clear the passage, and confirm the Suppositions implied in the Opinion; I shall in the next place Proceed to a more direct Treating of the chief matter in Hand.

PROP.

PROP. VI.

*That there is a World in the Moon,
hath been the direct Opinion of many
Ancient with some Modern Mathe-
maticians, and may Probably be
Deduced from the Tenents of others.*

Since this Opinion may be suspected of Singularity, I shall therefore first Confirm it by sufficient Authority of divers Authors, both Ancient and Modern, that so I may the better clear it from the Prejudice either of an Upstart Fancie, or an obsolete Errour. This is by some Attributed to *Orpheus*, one of the most Ancient Greek Poets. Who speaking of the Moon sayes thus, ἡ πολλὰ ἔρεα ἔχει, πολλὰ ἄσπεα, πολλὰ μίλαθρα, That it hath many Mountains, and Cities, and Houses in it. To him assented *Anaxagoras*, *Democritus*, and *Heraclides*, all who, thought it to have Firm Solid Ground, like to our Earth, Containing in it many Large Fields, Champion Grounds, and Divers Inhabitants.

Of this Opinion likewise was *Xenophanes*, as he is Cited for it by *Lactantius*; though that Father (perhaps) did mistake his meaning whilst he relates it thus, Dixit *Xenophanes*, intra concavum Lunæ esse aliam ter-

ram

ram, & ibi aliud genus hominum simili modo vivere sicut nos in hac terra, &c. As if he had conceived the Moon to be a great hollow Body, in the midst of whose concavity, there should be another Globe of Sea and Land, inhabited by Men, as our Earth is. Whereas it seems to be more likely by the Relation of others, that this Philosophers Opinion is to be understood in the same Sense, as it is here to be proved. True indeed, the Father Condemns this Assertion as an equall absurdity to that of *Anaxagoras*, who affirmed the Snow to be blak: but no wonder; for in the very next Chapter, it is that he does so much deride the Opinion of those who thought there were *Antipodes*. So that his Ignorance in that particular, may perhaps disable him from being a Competent Judg in any other the like point of Philosophy. Upon these agreed *Pythagoras*, who thought that our Earth was but one of the Planets which moved round about the Sun, (as *Aristotle* relates it of him) and the *Pythagoreans* in general did affirm that the Moon also was Terrestrial, and that she was inhabited as this lower World; That those living Creatures and Plants which are in her, exceed any of the like kind, with us in the same Proportion, as their Days are longer than ours: viz. By 15. times. This *Pythagoras* was esteemed by all, of a most Divine Wit, as appears especially by his Valuation amongst the Romans, who being

De Cælo. l. 2. cap. 13.

Plut. ibid. cap. 30.

Commanded by the Oracle to erect a Statue to the wisest *Græcian*, the Senate determined *Pythagoras* to be meant, preferring him in their Judgments before the Divine *Socrates*, whom their Gods pronounc'd the Wisest. Some think him a Jew by Birth; but most agree that he was much Conversant amongst the Learned sort and Priests of that Nation, by whom he was informed of many Secrets, and (perhaps) this Opinion which he vented afterwards in Greece, where he was much oppos'd by *Aristotle* in some worded Disputations, but never confuted by any solid Reason.

To this Opinion of *Pythagoras* did *Plato* also assent, when he considered that there was the like Eclipse made by the Earth; and this, that it had no Light of its own, that it was so full of spots. And therefore we may often read in him, and his followers, of an *ætherea terra*, and *lunares populi*, An Æthereal Earth, and Inhabiters in the Moon; but afterwards this was mixed with many ridiculous Fancies: For some of them considering the Myteries implied in the Number 3, concluded that there must necessarily be a Trinity of Worlds; whereof the first is this of ours; the second in the Moon, whose Element of Water is represented by the Spear of *Mercury*, the Air by *Venus*, and the Fire by the Sun. And that the whole Universe might the better end in Earth as it began, they have contri-

Semr. Astr.

But the Opinion which I have here delivered, was more directly Proved by (a) *Mæstin*, (b) *Keplar*, and (c) *Galilæus*, each of them late Writers, and famous Men. for their Singular skill in Astronomy. *Keplar* calls this World by the Name of *Levania* from the Hebrew Word *לכנה* which signifies the Moon, and our Earth by the name of *Volva à. volvendo*, because it does by Reason of its Diurnal Revolution appear unto them constantly to turn Round, and therefore he styles those who Live in that Hemisphere which is towards us, by the title of *Subvolvani*, because they enjoy the sight of this Earth; and the others *Privolvani, quia sunt privati conspectu volvæ*, because they are Deprived of this Priviledg. But *Julius Cæsar*, whom I have above Quoted, speaking of their Testimony whom I Cite for this Opinion, viz. *Keplar* and *Galilæus*, Affirms that to his Knowledg they did but jest in those things which they Write Concerning this, and as for any such world, he Assuredly knows

*De Pha-
enom. linnæ.
c4.*

knows they never so much as dreamt of it. But I had rather believe their own Words, than his pretended knowledg.

'Tis true indeed, in some things they do but trifle, but for the main Scope of those Discourses, 'tis as manifest they seriously meant it, as any indifferant Reader may easily discern; As for *Galilæus*, 'tis Evident that he did set down his own Judgment and Opinion in these things; otherwise, sure *Campanella* (a Man as well acquainted with his Opinion, and perhaps his Person, as *Cæsar* was) would never have writ an Apology for him. And besides, 'tis very likely if it had been but a Jest, *Galilæus* would never have suffered so much for it, as Report saith, afterwards he did.

And as for *Keplar*, I will only refer the Reader to his own words as they are set down in the Preface to the Fourth Book. of his *Epitome*, where his purpose is to make an Apology for the strangeness of those Truths that he was there to deliver, amongst which, there are divers things to this purpose concerning the Nature of the Moon. He professes that he did not publish them, either out of a Humour of Contradiction, or a desire of Vain-glory, or in a jesting way, to make himself, or others merry, but after a considerate and solemn manner, for the discovery of the Truth.

Now as for the knowledg which *Cæsar* pretends to the contrary, you may guess what it was by his strange confidence in other

Assertions, and his boldness in them may well Derogate from his Credit in this. For speaking of Ptolome's Hypothesis, he pronounces this Verdict, *Impossibile est excentricorum & epicyclorum positio, nec aliquis est ex Mathematicis adeo stultus qui veram illam existimet.* "The position of Excentrics and Epicycles is altogether impossible, nor is there any Mathematician such a Fool as to think it true. I should guess he could not have knowledge enough to maintain any other Hypothesis, who was so Ignorant in Mathematicks, as to deny, that any good Author held this. For I would fain know, whether there were never any that thought the Heavens to be Solid Bodies, and that there were such kinds of Motion, as is by those fained Orbs supplied; if so, *Cæsar la Galla* was much mistaken. I think his Assertions are equally true, that *Gallilæus* and *Keplar* did not hold this, and that there were none which ever held that other. Thus much for the Testimony of those who were directly of this Opinion.

But, in my following Discourse, I shall most insist on the Observation of *Galilæus*, the Inventor of that Famous Perspective, whereby we may discern the Heavens hard by us; whereby those things which others have formerly guest at, are manifested to the Eye, and plainly discovered beyond exception or doubt; of which admirable Invention, these latter Ages of the World may

may

may justly Boast, and for this, expect to be Celebrated by Posterity. 'Tis related of *Eudoxus*, that he wished himself Burnt with *Phæton*, so he might stand over the Sun to contemplate its Nature; had he Lived in these Days, he might have enjoyed his wish at an easier Rate, and Scaling the Heavens by this glass, might plainly have discerned what he so much desired. *Keplar* considering those strange discoveries which this Perspective had made, could not choose but Cry out in a *extremum* and Rapture of Admiration, *O multisicium & quovis (ceptra pretiosius perspicillum! an qui te dextrâ tenet, ille non dominus constituatur operum Dei!* And *Johannes Fabricius*, an Elegant Writer, speaking of the same glass, and for this Invention, preferring our Age before those former times of greater Ignorance, says thus; *Adeo sumus superiores veteribus, ut quam illi carminis magici pronuntiâ demissam representasse putantur, nos non tantum innocenter demittamus, sed etiam familiari quodam intuitu ejus quasi conditionem intueamur.* "So much are we above the Ancients, that whereas they were fain by their Magical Charms to represent the Moons approach, we cannot only bring her lower with a greater Innocence, but may also with a more familiar view behold her Condition. And because you shall have no occasion to question the Truth of those Experiments, which I shall afterwards urge from it; I will therefore set down the

*Demacula in sole ob-
ser.*

De pha-
nom. cap. I.

Testimony of an Enemy, and such a witness hath always been accounted prevalent: you may see it in the above named *Cæsar la Galla*, whose words are these: *Mercurium caduceum gestantem, caelestia nunciare, & mortuorum animas ab inferis revocare sapiens finxit antiquitas. Galilæum vero novum Jovis interpretem. Telescopio caduceo instructum Sydera aperire, & veterum Philosophorum manes ad superos revocare solers nostra ætas videt & admiratur.* "Wife Antiquity Fabled Mercury carrying a Rod in his Hand, to relate News from Heaven, and call back the Souls of the Dead; but it hath been the Happiness of our industrious Age to see and admire *Galilæus*, the New Embassadour of the Gods, furnished with his Perspective to unfold the Nature of the Stars, and awaken the Ghosts of the Ancient Philosophers. So worthily and highly did these Men esteem of this excellent Invention.

Now, if you would know what might be done by this glass, in the sight of such things as were nearer at Hand, the same Author will tell you, when he says, that by it those things which could scarce at all be discerned by the Eye, at the distance of a Mile and a half, might plainly and distinctly be perceived for 16 Italian Miles, and that as they were really in themselves, without any Transposition or falsifying at all. So that what the Ancient Poets were fain to put in a Fable, our more happy Age hath found

out

out in a Truth, and we may discern as far with these Eyes which *Galilæus* hath bestowed upon us, as *Lyneus* could with those which the Poets attributed unto him. But if you yet doubt, whether all these Observations were true, the same Author may confirm you, when he says they were shewed, *Non uni aut alteri, sed quamplurimis, cap. 1. neque gregariis hominibus, sed præcipuis atque disciplinis omnibus, necnon Mathematicis & Opticis præceptis optime instructis sedulâ ac diligenti inspectione.* "Not to one or two, but to very many, and those not ordinary Men, but to those who were well vers'd in Mathematicks and Opticks, and that not with a meer glance, but with a Sedulous and diligent Inspection. And least any scruple might remain unanswered, or you might think the Men who beheld all this, though they might be skilful, yet they came with Credulous Minds, and so were more easie to be deluded: He adds, that it was shewed, *Viris qui ad experimenta hæc contradicendi animo accesserant. cap. 5.* "To such as were come with a great deal of Prejudice, and an intent of Contradiction. Thus you may see the certainty of those Experiments which were taken by this glass. I have spoken the more concerning it, because I shall borrow many things in my Farther Discourse, from those Discoveries which were made by it.

I have now Cited such Authors both Ancient and Modern, who have directly

See the
Second
Book.
1. Prop.

*Apologia
pro Galli-
leo.*

maintained the same Opinion. I told you likewise in the Proposition, that it might probably be deduced from the Tenents of others: such were *Aristarchus*, *Philolaus*, and *Copernicus*, with many other later Writers, who assented to their Hypothesis; so *Joach. Rhelicus*, *David Origanus Lansbergius*, *Guil. Gilbert*, and (if I may beleive *Campanella*) *Innumeri alii Angli & Galli*; Very many others, both English and French, all who affirmed our Earth to be one of the Plannets, and the Sun to be the Center of all, about which the Heavenly Bodies did move. And how horrid soever this may seem at the first, yet is it likely enough to be true, nor is there any Maxime or Observation in Opticks, (saith *Pena*) that can Disprove it.

Now if our Earth were one of the Plannets, (as it is according to them) then why may not another of the Plannets be an Earth.

Thus have I shewed you the Truth of this Proposition. Before I proceed farther, 'tis requisite that I enform the Reader, what Method I shall follow in the proving of this chief Assertion, that there is a World in the Moon.

The Order by which I shall be guided, will be, that which *Aristotle* uses in his Book, *De mundo*, (if that Book were his.)

First, *ὅτι τὸ ἐν αὐτῇ* of those chief parts which are in it; not the Elementary

tary and Æthereal, (as he doth there) since this doth not belong to the present Question, but of the Sea and Land, &c. Secondly, *πρὸς αὐτὴν καὶ ἄλλω*, of those things which are Extrinsecal to it, as the Seasons, Meteors, and Inhabitants.

PROP. VII.

That those Spots and brighter Parts, which by our Sight may be distinguished in the Moon, do shew the Difference betwixt the Sea and Land, in that other World.

FOR the clear proof of this Proposition, I shall first reckon up and refute the Opinions of others, concerning the matter and form of those Spots, and then shew the greater probability of this present Assertion, and how agreeable it is to that Truth; which is most commonly received; As for the Opinions of others, concerning these, they have been very many; I will only reckon up those which are Common and Remarkable.

Some there are that think those Spots do not arise from any deformity of the parts, but a deceit of the Eye, which cannot at

So Bede in
l. de Mund.
constit.

such a distance discern an equal Light in that Planer; but these do but only say it, and shew not any reason for the proof of their Opinion: Others think, that there are some Bodies betwixt the Sun and Moon, which keeping off the Light in some parts, do by their shadow produce these Spots which we there discern.

De subtil.
lib. 3.

Others would have them to be the Figure of the Seas or Mountains, here Below: Represented there as in a Looking-Glass. But none of those Fancies can be True, because the Spots are still the same, and not Varied according to the Difference of Places; and besides, Cardon thinks it is Impossible that any Image should be Conveyed so far, as there to be Represented unto us, at such a Distance. But 'tis Commonly related of *Pythagoras*, that he by Writing what he pleased in a Glass, by the Reflexion of the same Species, would make those Letters to appear in the Circle of the Moon, where they should be Legible by any other, who might at that

a Occulta.
Philos. l. 1.
cap. 6.

time be some Miles distant from him (a). *Agrippa* affirms this to be Possible, and the way of performing it not unknown to himself, with some others in his time. It may be, that Bishop *Godwine* did by the like means Perform those strange Conclusions, which he professes in his *Nuncius inanimatus*, where he Pretends, that he can Inform his Friends of what he pleases, though they be an Hundred Miles distant,

distant, *forte etiam, vel milliare millesimum*, (they are his own Words) and perhaps, a Thousand, and all this in a Little Space, Quicker than the Sun can Move.

Now, what conveyance there should be, for so Speedy a Passage, I cannot Conceive, unless it be Carried with the Light, than which we know not any thing Quicker; But of this only by the way; however, whether those Images can be Represented so or not, yet certain it is, those Spots are not such Representations. Some think, that when God had at first Created too much Earth, to make a perfect Globe, not knowing well where to Bestow the rest, he Placed it in the Moon, which ever since hath so Darkned it in some Parts; but the Impiety of this is sufficient Confutation, since it so much Detracts from the Divine Power and Wisdom.

The (a) Stoicks held that Planer to be mixed by Fire and Air, and in their Opinion, the Variety of its Composition caused her Spots: being not ashamed to stile the same Body a Goddess, calling it *Diana*, *Minerva*, &c. and yet Affirm it be an Impure Mixture of Flame, and Smoke, and Fuliginus Air.

a Plut. de
placit. phil.
l. 2. c. 25.

But this Planer cannot consist of Fire (saith *Plutarch*) because there is not any Fewel to Maintain it. And the Poets have therefore fained *Vulcan* to be Lame, because

cause he can no more Subsist without Wood or other Fewell, than a Lame Man without a Staff.

Anaxagoras thought all the Stars to be of an Earthly Nature, Mixed with some Fire; and as for the Sun, he Affirmed it to be nothing else but a Fiery Stone; for which latter Opinion, the *Athenians* Sentenc'd him to Death, those Zealous Idolaters counting it a great Blasphemy to make their God a Stone, whereas notwithstanding, they were so senseless in their Adoration of Idols, as to make a Stone their God. This *Anaxagoras* Affirmed the Moon to be more Terrestrial than the other Planets, but of a greater Purity than any thing here Below, and the Spots, he thought, were nothing else, but some Cloudy parts, Intermingled with the Light which belonged to that Planet; but I have above Destroyed the Supposition on which this fancy is Grounded. *Pliny* thinks they Arise from some Drossie stuff, Mixed with that Moysture which the Moon Attracts unto her self; but he was of their Opinion, who thought the Stars were Nourished by some Earthly Vapours, which you may commonly see Refuted in the *Commentators* on the Books *de Cælo*.

comment.
in Purb.
p. 164.

Vitellio & *Keinoldus*, Affirm the Spots to be the Thicker parts of the Moon, into which the Sun cannot Infuse much Light; and this (say they) is the Reason why in the

the Suns Eclipses, the Spots and Brighter Parts, are still in some measure Distinguished, because the Sun Beams are not able so well to Penetrate through those Thicker, as they may through the Thinner parts of that Planet. Of this Opinion also was *Cæsar la Galla*, whose Words are these, "The Moon doth there appear Clearest, where she is Transpicious, not only through the Superficies, but the Substance also, and there she seems spotted, where her Body is most Opacous. The ground of this his Assertion, was, because he thought the Moon did receive and bestow her Light by Illumination only, and not at all by reflexion; but this, together with the supposed Penetration of the Sun-Beams, and the Perspicuity of the Moons Body, I have above Answered and Refuted.

The more Common and general Opinion, is, that the Spots are the Thinner parts of the Moon, which are less able to reflect the Beams that they receive from the Sun, and this is most agreeable to reason; for if the Stars are therefore brightest, because they are Thicker, and more Solid than their Orbs, then it will follow, that those parts of the Moon which have less Light, have also less Thickness. It was the Providence of Nature (say some) that so contrived that Planet to have these Spots within it; for since that is nearest to those lower Bodies which are so full of deformity, 'tis requi-

Ex qua parte luna est transpiciua non solum secundum superficiem sed etiam secundum substantiam, eatenus clara, ex qua autem parte opaca est, eatenus obscura videtur. De Phenom. cap. 11. Albert. mag. de Co. vis. Q. 4. Art. 21. Colleg. Con.

De Som-
niis.

quifite that it fhould in fome meafure agree with them, and as in this Inferiour World, the higher Bodies are the moft compleat, fo alfo in the Heavens, Perfection is afcended unto by degrees, and the Moon being the loweft, muft be the leaft pure, and therefore *Philo* the Jew, Interpreting *Jacobs* Dream, concerning the Ladder, doth in an Allegory fhew, how that in the Fabrick of the World, all things grow perfecter, as they grow higher, and this is the reafon (faith he) why the Moon doth not confift of any pure fimple matter, but is mixed with Air, which fhews fo darkly within her Body.

But this cannot be a Sufficient reafon; for though it were true, that Nature did frame every thing perfecter, as it was higher, yet is it as true, that Nature frames every thing fully perfect for that Office to which ſhe intends it. Now, had ſhe intended the Moon meerly to reflect the Sun-Beams, and give Light, the Spots then had not fo much argued her Providence, as her unskillfulnefs and oversight, as if in the haft of her work, ſhe could not tell how to make that Body exactly fit, for that Office, to which ſhe intended it.

Scalig. ex-
cerpt. 62.

'Tis likely then, that ſhe had ſome other end which moved her to produce this variety, and this in all probability was her intent to make it a fit Body for Habitation, with the ſame Conveniences of Sea and Land; as this Inferiour World doth partake of.

of. For ſince the Moon is ſuch a Vaſt, ſuch a Solid and Opacous Body, like our Earth (as was above proved) why may it not be probable, that thoſe Thinner and Thicker parts appearing in her, do ſhew the difference betwixt the Sea and Land in that other World? and *Gallilæus* doubts not, but that if our Earth were viſſible at the ſame diſtance, there would be the like appearance of it.

If we conſider the Moon as another Habitable Earth, then the appearances of it will be altogether exact, and beautiful, and may argue unto that, it is fully accompliſhed for all thoſe ends to which Providence did appoint it. But conſider it barely as a Star or Light, and then there will appear in it much Imperfection and Deformity, as being of an Impure Dark Subſtance, and ſo unfit for the Office of that Nature.

As for the Form of thoſe Spots, ſome of the Vulgar think, they represent a Man, and the Poets gueſs, 'tis the Boy *Endymion*, whoſe Company ſhe Loves ſo well, that ſhe carries him with her; others will have it only to be the Face of a Man, as the Moon is uſually pictured; but *Albertus* thinks rather, that it represents a Lyon, with his Tail towards the Eaſt, and his Head the Weſt, and * ſome others have thought it to be very much like a Fox, and certainly, 'tis as much like a Lyon, as that in the *Zodiaks*, or as *Urſa major* is like a Bear.

* *Eusebius*
Nicemb.
Hiſt. Nat.
l. 8. c. 15.

I should guess, that it represents one of these, as well as another, and any thing else, as well as any of these, since 'tis but a strong Imagination, which Fancies such Images, as School Boys usually do, in the marks of a Wall, whereas there is not any such Similitude in the Spots themselves, which rather like our Sea, in respect of the Land, appears under a Rugged and Confused Figure, and doth not represent any distinct Image, so that both in respect of the matter, and the Form, it may be probable enough, that those Spots and brighter parts, may shew the distinction betwixt the Sea and Land, in that other World.

PROP.

PROP. VIII.

*The Spots represent the Sea, and
the brighter Parts the Land.*

When I first compared the Nature of our Earth and Water, with those appearances in the Moon; I concluded contrary to the Proposition, that the brighter Parts represented the Water, and the Spots the Land; of this Opinion likewise was *Keplar* at the first. But my second Thoughts, and the reading of others, have now convinced me (as after he was) of the Truth of that Proposition which I have now set down. Before I come to the Confirmation of it, I shall mention those Scruples, which at first made me doubt the Truth of this Opinion.

1. It may be Objected, 'tis Probable, if there be any such Sea and Land as ours, that it bears some Proportion and Similitude with ours, but now this Proposition takes away all Likeness betwixt them. For whereas the Superficies of our Earth is but the Third part of the whole Surface in the Globe, Two Parts being overspread with the Water (as *Scaliger* *Exercis.* 39. Ob.

Op. Astro.
c. 6. num. 9.
Dissert.
cum nuncio
Gak

observes) yet here, according to this Opinion, the Sea should be less than the Land, since there is not so much of the Bepotted, as there is of the Enlightened parts, wherefore 'tis Probable, that there is no such thing at all, or else, that the Brighter parts are the Sea.

2. The Water, by Reason of the Smoothness of its Superficies, seems better able to Reflect the Sun-Beams than the Earth, which in most Places is so full of Ruggedness of Grass and Trees, and such like Impediments of Reflexion; and besides, common Experience shews, that the Water Shines with a greater and more Glorious Brightness than the Earth; therefore it should seem that the Spots are the Earth, and the Brighter parts the Water. But to the First it may be Answered.

1. There is no great Probability in this Consequence, that because 'tis so with us, therefore it must be so with the parts of the Moon, for since there is such a Difference betwixt them in Divers other Respects, they may not perhaps Agree in this.

*Do Metto-
ris l. 5. c. 1.
Art. 1.*

2. That Assertion of Scaliger is not by all Granted for a Truth. *Fromundus*, with others, think, that the Superficies of the Sea and Land, in so much of the World as is already Discovered, is equal, and of the same Extension.

3. The Orbe of Thick and Vaporous Air

Air which Incompases the Moon, makes the Brighter parts of that Planet appear Bigger than in themselves they are; as I shall shew afterwards.

To the Second it may be Answered, that though the Water be of a smooth Superficies, and so may seem most fit to Reverberate the Light, yet because 'tis of a Prespecuous Nature, therefore the Beams must Sink into it, and cannot so Strongly and Clearly be Reflected. *Sicut in speculo ubi plumbum abrasum fuerit*, (saith Cardan) as in Looking-Glasses where part of the Lead is Razed off, and nothing left behind to Reverberate the Image, the Species must there pass through and not Back again, so it is where the Beams Penetrate and Sink into the Substance of the Body, there cannot be such an Immediate and strong Reflexion, as when they are Beat back from the Superficies, and therefore the Sun causes a greater Heat by far upon the Land than upon the Water. Now as for that Experiment where it is said, that the Waters have a greater Brightness than the Land: I Answer, 'tis true only there where they Represent the Image of the Sun or some Bright Cloud, and not in other places, Especially if we look upon them at any great Distance, as is very Plain by common Observation.

And 'tis certain that from any high Mountain the Land does appear a great

G

deal

deal Brighter than any Lake or River.

This may yet be farther Illustrated by the Similitude of a Looking-Glass hanging upon a Wall in the Sun-shine, where, if the Eye be not placed in the just line of Reflexion from the Glass, tis Manifest that the Wall will be of a Brighter Appearance than the Glass. True indeed in the Line of Reflexion, the Light of the Glass is Equal almost unto that which comes Immadiately from the Sun it self; but now this is only in one Particular place, and so is not like that Brightness which we Discern in the Moon, because this does Appear Equally in several Scituations, like that of the Wall which does seem Bright as well from every place as from any one. And therefore the Ruffness of the Wall, or (as it is in the Objection) the Ruggedness of our Earth is so far from being an hinderance of such a Reflexion as there is from the Moon, that it is rather Required as a Necessary Condition unto it. We may conceive that in every rough Body there are, as it were, innumerable Surfaces, Disposed unto an Innumerable Diversitie of Inclinations. *Ita ut nullus sit locus; ad quem non pertingant plurimi radii reflexi a plurimis superficieculis, per omnem corporis scabri radiis luminosis percussi superficiem dispersis.* "So that there is not any place unto which there are not some Beams Reflected from these Divers Surfaces, in the several parts of such a rugged Body. But yet (as I said before)

Galileus
System. coll.
1.

fore) the Earth does Receive a great part of its Light by Illumination, as well as by Reflexion.

So that notwithstanding those Doubts, yet this Proposition may remain True, that the Spots may be the Sea, and the Brighter parts the Land. Of this Opinion was Plutarch: unto him Allented Kepler and Galileus, whose words are these, *Siquis veterum Pythagoreorum sententiam excusare velit, lunam scilicet esse quasi tellurem alteram, ejus pars lucidior terranam superficiem, obscurior vero aqueam magis congrue representet. Mibi autem dubium fuit nunquam terrestri globi a longa conspectu, atque a radiis solaribus perfusi, terram superficiem clariorē, obscuriorem vero aqueam sese in conspectum daturam.* "If any Man have a mind to Renew the Opinion of the Pythagoreans, that the Moon is another Earth, then her Brighter parts may fitly Represent the Earths Surfaces, and the Darker parts the Water: and for my part, I never Doubted but that our Earthly Globe being Shined upon by the Sun, and beheld at a great Distance, the Land would appear Brightest, and the Sea more Obscurely. The Reasons may be.

1. That which I urged about the foregoing Chapter, because the Water is the Thinner part, and therefore must give less Light.

Since the Stars and Planets, by Reason of their Brightness, are usually con-

De facie
lun.
Dissertatio
Nunc. Syd.

concluded to be the Thicker parts of her Orb.

In lib. de
coloribus.

2. Water is in it self of a Blacker Colour (saith Aristotle) and therefore more Remote from Light than the Earth. Any parts of the Ground being Moistened with Rain, does Look much more Darkly than when it is Dry.

3. 'Tis Observed that the Secondary Light of the Moon (which afterwards is Proved to Proceed from our Earth) is Sensibly Brighter unto us, for two or three Dayes before the Conjunction, in the Morning when she Appears Eastward, than about the same time after the Conjunction, when she is seen in the West. The Reason of which must be this, because that part of the Earth which is Opposite to the Moon in the East, has more Land in it than Sea. Whereas on the Contrary, the Moon when she is in the West, is Shined upon by that part of our Earth where there is more Sea than Land, from whence it will follow with good Probability that the Earth does cast a greater Light than the Water.

4. Because Observation tells us, that the Spotted parts are always Smooth and Equal, having every where an Equality of Light when once they are Enlightned by the Sun, whereas the Brighter parts are full of rugged Gibbosities and Mountains, having many Shades in them, as I shall shew more at Large afterwards.

That

That in this Planet there must be Seas, Campanella Indeavours to prove out of Scripture, Interpreting the Waters above the Firmament Spoken in Genesis, to be meant of the Sea in this World. For (saith he) 'tis not likely that there are any such Waters above the Orbs to Moderat that Heat which they receive from their Swift Motion (as some of the Fathers think.) Nor did Moses mean the Angels which may be called Spiritual Waters, as Origen and Austin would have it, for both these are Rejected by the General consent: *Vide. Ieron. Epist. ad Pammachium.* Nor could he mean any Waters in the second Region, as most Commentators Interpret it, For first, there is nothing but Vapours, which though they are afterwards turned into Water, yet while they Remain there, they are only the Matter of that Element, which may as well be Fire, or Earth, or Air. Secondly, Those Vapours are not above the Expanse, but in it. So that he thinks there is no other way to salve all, but by making the Planets several Worlds with Sea and Land, with such Rivers and Springs as we have here below: Especially since Esdras Speaks 2 Esdr. 4.7 of the Springs above the Firmament. But I cannot agree with him in this, nor do I think that any such thing can be Proved out of Scripture.

Before I Proceed to the next Position, I shall first Answer some Doubts which might be made against the Generality of this

this Truth, whereby it may seem Impossible that there should be either Sea or Land in the Moon; for since she moves so Swiftly as Astronomers Observe, why then does there nothing Fall from her, or why doth she not Shake something out by the Celerity of her Revolution; I Answer, you must know that the Inclination of every heavy Body to its Proper Center, doth Sufficiently tie it unto its Place; so that Suppose any thing were Separated, yet must it Necessarily return again. And there is no more Danger of their Falling into our World, than there is Fear of our Falling into the Moon.

But yet there are many Fabulous Relations of such things as have Dropped thence. There is a Tale of the Nemean Lyon that *Hercules* Slew, which first

Vide Gult: Nabrigens. de rebus Anglicis: lib. 1. Rushing among the Herds out of his unknown Den in the Mountain of *Cythera* in *Bæotia*, the Credulous People thought he was sent from their Goddess the Moon. And if a Whirl-Wind did chance to Snatch any thing up, and afterwards Rain it Down again, the Ignorant Multitude were apt to believe that it Dropt from Heaven. Thus *Ævictenna* relates the Story of a Calf which fell down in a Storm, the beholders thinking it a Moon-Calf, and that it fell thence. So *Cardan* Travelling upon the Apennine Mountains, a sudden Blast took off his Hat, which if it had been carried

ryed

ryed far, he thinks the peasants, who had perceived it to Fall, would have Sworn it had Rained Hats. After some such Manner, many of our Prodiges come to Pass, and the People are willing to believe any thing, which they may Relate to others as a very Strange and Wonderful Event. I doubt not but the Trojan *Palladium*, the Roman *Minerva*, and our Ladies Church at *Loretto*, with many sacred Reliques preserved by the Papists might Drop from the Moon as well as any of these.

But it may be again Objected, suppose there were a Bullet Shot up in that World, would not the Moon run away from it, before it could fall down, since the Motion of her Body (being every Day round our Earth) is far Swifter than the other, and so the Bullet must be left behind, and at Length fall down to us? To this I Answer.

1. If a Bullet could be Shot so far till it came to the Circumference of those things which belong to our Center, then it would fall down to us.

2. Though there were some Heavy Body a great Height in that Air, yet would the Motion of that Magnetical Globe to which it did belong by an attractive Vertue still hold it within its Convenient distance, whether their Earth Moved or stood Still, yet would the same Violence cast a Body from it Equally far.

That the Moon may be a World.

far. That I may the plainer Express my meaning, I will set down this Diagramme.

Suppose this Earth were A, which was to Move in the Circle C. D. and let the Bullet be Supposed at B. within its Proper Verge; I say, whether this Earth did Stand still or Move Swiftly towards D, yet the Bullet would still keep at the same Distance by reason of that Magnetick Vertue of the Center (if I may so Speak) whereby all things within its Sphear are Attracted with it. So that the Violence to the Bullet, being nothing else but that where-

That the Moon may be a World.

whereby 'tis Removed from its Center, therefore an equal Violence can Carry a Body from its Proper place, but at an equal Distance, whether or no this Earth where its Center is, does Stand still or Move.

The Impartial Reader may find sufficient Satisfaction for this and such other Arguments as may be Urged against the Motion of that Earth, in the Writings of *Copernicus* and his followers, unto whom, for Brevities sake, I will Refer them.

PROP.

PROP. IX.

That there are high Mountains, deep Vallies, and spacious Plains in the Body of the Moon.

THough there are some, who think Mountains to be a Deformity to the Earth, as if they were either Beat up by the Flood, or else Cast up like so many Heaps of Rubbish left at the Creation; yet if well Considered, they will be found as much to Conduce to the Beauty and Conveniency of the Universe, as any of the other Parts. Nature (saith *Pliny*) Purposely framed them for many Excellent Uses: partly to Tame the Violence of greater Rivers, to strengthen certain joynts within the Veins and Bowels of the Earth, to break the Force of the Seas Inundation, and for the safety of the Earths Inhabitants, whether Beasts or Men. That they make much for the Protection of Beasts, the Psalmist testifies,
The

The high Hills are a refuge for the Wild Plal. 104. Goats, and the Rocks for the Comies. The v. 18.

The Kingly Prophet had likewise Learned the Safety of these by his own Experience, when he also was Fain to make a Mountain his Refuge from the Fury of his Master Saul, who Persecuted him in the Wilderiness.

True indeed, such places as these keep their Neighbours poor, as being most Barren, but yet they preserve them safe, as being most strong; witness our unconquered Wales and Scotland, whose greatest Protection hath been the Natural Strength of their Country, so Fortified with Mountains, that these have always been unto them, sure Retreats from the Violence and Oppression of others. Wherefore a good Author doth Rightly call them Natures Bul-warks, cast up at God Almighty's own charges, the Scorns and Curbs of Victorious Armies; which made the Barbarians in *Curtius* so confident of their own safety, when they were once retired to an inaccessible Mountain, that when *Alexanders* Legate had brought them to a Parley, and perswading to yeild, told them of his Masters Victories, what Seas and Wilderinesses he had passed; they replied, that all that might be, but could *Alexander* Fly too. Over the Seas he might have Ships, and over the Land Horses, but he must have Wings before he could get up thither. Such safety did those Barbarous Nations conceive

ceive in the Mountains whereunto they were retired. Certainly then such useful parts were not the Effect of Mans Sin, or produced by the Worlds Curse, the Flood, but rather at the first Created by the Goodness and Providence of the Almighty.

This Truth is usually concluded from these and the like Arguments.

1. Because the Scripture it self, in the Description of that general Deluge, tells us, it overflowed the highest Mountains.

2. Because *Moses* who writ long after the Flood, does yet give the same Description of Places and Rivers, as they had before; which could not well have been if this had made so strange an Alteration.

3. 'Tis Evident that the Trees did stand as before. For otherwise *Noah* could not so well have concluded, that the Waters were abated, from this reason, because the Dove brought an Olive Leaf in her Mouth, when she was sent forth the Second time: whereas had the Trees been rooted up, she might have taken it the first time, from one of them as it was Floating on the Top of the Waters. Now if the Motion of the Water was not so Violent as to Subvert the Trees, much less was it able to cast up such vast heaps as the Mountains.

4. When the Scripture doth set forth unto us the Power and Imensity of God by the Variety or Usefulness of the Creatures which

which he hath made, amongst the rest it doth often mention the Mountains. *Psal.* 104. 8. item. 148. 9. *Isai.* 40. 12. And therefore 'tis probable they were Created at the first. Unto this I might add, that in other Places Divine Wisdom, in shewing of its own Antiquity, saith, that he was *From the beginning, before the Earth or the Mountains were brought forth.* *Prov.* 8. 25. *Psal.* 90. 2.

5. If we may Trust the Relations of Antiquity, there were many Monuments left undefaced after the Flood. *Joseph Ant.* lib. 1. c. 3.

So that if I intend to prove that the Moon is such a Habitable World as this is; 'tis requisite that I shew it to have the same Conveniences of Habitation as this hath; and here if some Rabbi or Chymick were to handle the Point, they would first prove it out of Scripture, from that place in *Moses* his Blessing, where he speaks of the Ancient Mountains and lasting Hills, *Deut.* 33. *חרי קרם וגבעות עולם* for having immediately before mentioned those Blessings which should happen unto *Joseph* by the Influence of the Moon, he does presently Exegetically Iterate them in Blessing him with the chief things of the Ancient Mountains and lasting Hills; you may also see the same expression used in *Jacobs* Blessing of *Joseph*.

Gen. 49. 26.

But however we may deal *pro* or *con* in Philosophy, yet we must not be too bold with Divine Truths, or bring Scripture to Patronize any Fancy of our own, though, per-

perhaps, it be a Truth. I am not of their Mind who think it a good Course to Confirm Philosophical Secrets from the letter of the Scripture, or by abusing some Obscure Text in it. Merhinks it favors too much of that Melancholly Humour of the Chymicks, who, aiming in all their studies at the making of gold, do persuade themselves, that the most Learned and Subtile of the Ancient Authors, in all their Obscure Places do mean some such Sense as may make to their purpose. And hence it is that they deriue such strange Mysteries from the Fables of the Poets, and can tell you what great Secret it was that Antiquity did hide under the Fiction of *Jupiter* being turned into a Shower of Gold: of *Mercurius* being made the Interpreter of the Gods: of the *Moon* descending to the Earth for the Love of *Endymion*: with such Ridiculous Interpretations of these and the like Fables, which any reasonable considering Man cannot conceive to proceed from any, but such as are distracted. No less Ear-rattical in this kind are the Jewish Rabbies, amongst whom is not any Opinion, whether in Nature or Policy, whether true or false, but some of them, by a Cabalistical Interpretation can Father it upon a dark Place of Scripture, or (if need be) upon a Text that is clean contrary. There being not any Absurdity so gross and incredible for which these Abusers of the Text, will not find out an Argument. Whereas 'tis the

the more Natural way, and should be Observed in all Controversies, to apply unto every thing, the proper proofs of it; and when we deal with Philosophical Truths, to keep our selves within the bounds of Humane Reason and Authority.

But this by the way. For the better proof of this Proposition, I might here Cite the Testimony of *Diadorus*, who thought the Moon to be full of Rugged Places, *velut terrestribus tumultis superaliosam*; but he Erred much in some Circumstances of this Opinion, especially where he says, there is an Island amongst the *Hyperboreans*, wherein those Hills may to the Eye be plainly discovered; and for this reason. * *Caelius* * *Leff. aut.* calls him a Fabulous Writer. But you may l. 1. c. 15. see more express Authority for the Proof of this in the Opinions of *Anaxagoras* and *Demo-* Plut. de
Plac. l. 2. c.
25.
erius, who held that this Plannet was full of Champion Grounds, Mountains and Vallies. And this seemed likewise probable unto *Augustinus Nisus*, whose words are De Caelo l.
2. part. 49.
these: *Forſitan non eſt remotum dicere lunæ partes eſſe diuerſas, veluti ſunt partes terræ, quarum aliæ ſunt valloſæ, aliæ montioſæ, ex quarum differentia effici poteſt facies illa lunæ; nec eſt rationi diſſonum, nam luna eſt corpus im-*
perfectè Sphæricum, cum ſit corpus ab ultimo
caelo elongatum, ut ſupra dixit Ariſtoteles.
“ Perhaps, it would not be amiſs to ſay
“ that the parts of the Moon were diuers,
“ as the parts of this Earth, whereof ſome
“ are Vallies, and ſome Mountains, from
“ the

*De Mundi
fab. pars. 3.
c. 4.*

*Astron.
Opr. c. 6.
num. 9.*

"the difference of which, some Spots in
"the Moon may proceed; nor is this a-
"gainst reason; for that Planer cannot
"be perfectly Spherical, since 'tis so remote
"a Body from the first Orb, as *Aristotle*
"had said before. You may see this Truth
assented unto by *Blattanus* the Jesuite, and
by him confirmed with divers Reasons.
Keplar hath Observed in the Moons Eclip-
ses, that the Division of her enlightned part
from the shaded; was made by a crooked
unequal Line; of which there cannot be
any probable cause conceived, unless it did
arise from the Ruggedness of that
Planer; for it cannot at all be produc'd
from the shade of any Mountains here
upon Earth; because these would be so
lessened before they could reach so high in a
Conical shadow, that they would not be at
all sensible unto us (as might easily be De-
monstrated) nor can it be conceived what
reason of this difference there should be in
the Sun. Wherefore there being no other
Body that hath any thing to do in Eclipses;
we must necessarily conclude, that it is cau-
sed by variety of parts in the Moon it self;
and what can these be but its Gibbosi-
ties? Now if you should ask a reason why
there should be such a Multitude of these
in that Planer, the same *Keplar* shall jest you
out an Answer. Supposing (saith he) that
those Inhabitants are bigger than any of us
in the same proportion, as their days are
longer than ours, viz. By Fifteen times it
may

may be, for want of Stones to Erect such vast
Houses as were requisite for their Bodies,
they are fain to Dig Great and Round Hol-
lows in the Earth, where they may both
procure Water for their Thirst, and turning
about with the shade, may avoid those
great Heats which otherwise they would be
liable unto, or if you will give *Cæsar la*
Galla leave to guess in the same manner,
he would rather think that those Thirsty
Nations cast up so many, and so great heaps
of Earth in digging of their Wine Cellars;
but this only by the way.

*Keplap-
pend. Sele-
nogra.*

*Nuncius
Syderous.*

I shall next produce Eye-witness of *Ga-
lileus*, on which I most of all depend for
the proof of this Proposition, when he be-
held the new Moon through his perspective,
it appeared to him under a Rugged and
Spotted Figure, seeming to have the dark-
er and enlightned parts divided by a Tor-
tuous Line, having some Parcels of Light
at a good distance from the other; and this
difference is so remarkable, that you may
easily perceive it through one of those or-
dinary Perspectives, which are commonly
sold amongst us; but for your better ap-
prehending of what I deliver, I will set
down the Figure as I find it in *Galileus*.

Suppose ABCD to represent the appearance of the Moons Body being in a Sextile, you may see some brighter parts Separated at a pretty distance from the other, which can be nothing else but a Reflexion of the Sun-Beams, upon some parts that are higher than the rest, and those Obscure Gibbosities which stand out towards the enlightened parts, must be such Hollow and Deep Places, whereto the Rays cannot Reach.

But

But when the Moon is got farther off from the Sun, and come to that fulness as this Line BD doth represent her under, then do these parts also receive an equal Light, excepting only that difference which doth appear betwixt their Sea and Land. And if you do consider how any Rugged Eddy would appear, being enlightned, you would easily conceive that it must necessarily seem under some such Gibbous unequal form, as the Moon is here represented. Now for the Infallibility of these appearances, I shall refer the Reader to that which hath been said in the Sixth Proposition.

But *Cæsar la Galle* affirms, that all these appearances may consist with a plain Superficies, if we suppose the parts of the Body to be some of them *Diaphanous*, and some *Opacous*; and if you Object, that the Light which is convey'd to any Diaphanous part in a plain Superficies, must be by a continued Line, whereas here there appear many brighter parts among the Obscure, at some distance from the rest. To this he answers, it may arise from some Secret Conveyances and Channels within her Body; that do consist of a more Diaphanous matter, which being covered over with an Opacous Superficies, the Light passing through them, may break out a great way off; whereas the other parts betwixt, may still remain Dark. Just as the River *Aretusa* in *Sicily*, which runs under ground for a great way, and afterwards breaks out again. But because this is one of the

H 2

cheit

chiefest Fancies, whereby he thinks he hath fully answered the Argument of this Opinion; I will therefore set down his answer in his own words, lest the Reader might suspect more in them, than I have expressed.

cap. 11.

Non est impossibile cæcos ductus diaphani & perspicui corporis, sed opacâ superficie protendi, usque in diaphanam aliquam ex profund. in superficiem emergentem partem, per quos ductus lume inlonga post. modum interstitio erumpat, &c. But I reply, if the Superficies betwixt these two enlightened parts, remain dark because of its Opacity, then would it always be dark, and the Sun could not make it partake of Light, more than it could of Perspicuity: But this contradicts all Experience, as you may see in *Galileus*, who affirms, that when the Sun comes nearer to his Opposition, then, that which is betwixt them both, is enlightned as well as either. Nay, this opposes his own Eye-witness, for he confesses himself, that he saw this by the glass. He had said before, that he came to see those strange Sights discovered by *Galileus* his glass, with an intent of Contradiction, and you may read that confirmed in the weakness of this answer, which rather bewrays an Obstinate, than a perswaded Will; for otherwise sure he would never have undertook to have destroyed such certain proofs with so groundless a Fancy.

*Syst. mundi
vol. 1.*

That Instance of *Galileus*, would have been a better Evasion, had this Author been Acquainted with it; who might then have compared the Moon to that which we call Mother of Pearl, which though it be

most

most Exactly Polished in the Superficies of it; yet will seem unto the Eye as if there were divers Swellings and Risings in its several Parts. But yet, this neither would not well have shifted the Experiment of the Perspective. For these rugged parts do not only appear upon one side of the Moon, but as the Sun does turn about in Divers Places, so do they also cast their Shadow. When the Moon is in her Increase, then do they cast their shadows to the East. When she is in the Decrease, and the Sun on the other side of her, then likewise may we Discover these brighter Parts casting their shadowes Westward. Whereas in the full Moon there are none of all these to be seen.

But it may be Objected, that 'tis almost Impossible, and all together Unlikely, that in the Moon there should be any Mountains so high, as those Observations make them. For do but Suppose, according to the common Principles, that the Moons Diameter unto the Earths, is very near to the Proportion of 2 to 7. Suppose withall that the Earths Diameter contains about 7000. Italian Miles, and the Moons 2000. (as is commonly granted.) Now *Galileus* hath Observed; that some parts have been Enlightned, when they were the Twentieth part of the Diameter distant from the common term of Illumination. From whence, it must necessarily follow, that there may be some Mountains in the Moon, so high, that they are Able to cast a shadow a 100 Miles off. An opinion

H 3

that

that sounds like a Prodigy, or a Fiction wherefore 'tis likely that either those Appearances are caused by somewhat else besides Mountains, or else those are fallible Observations, from whence may follow such Improbable, Inconceivable Consequences.

But to this I Answer :

1. You must Consider the height of the Mountains is but very little, if you compare them to the Length of their shadows. Sir *Walter Rawleigh* Observes, that the Mount *Athos*, now called *Lacas*, casts its shadow 300 Furlongs, which is above 37 Miles; and yet that Mount is none of the Highest. Nay, *Solinus* (whom I should rather beleive in this kind) affirms, that this Mountain gives his shadow quite over the Sea, from *Macedon* to the isle of *Lemnos*, which is 700 Furlongs, or 84 Miles, and yet according to the common Reckoning it doth scarce reach 4 Miles upwards, in its Perpendicular height.

2. I affirm, that there are very high Mountains in the Moon. *Keplar* and *Galileus* think, that they are higher than any which are upon our Earth. But I am not of their Opinion in this, because I suppose they go upon a false Ground, whilst they Conceive, that the highest Mountain upon the Earth is not above a Mile Perpendicular.

Whereas 'tis the common Opinion, and found true enough by Observation, that *Olympus*, *Athos*, *Taurus* and *Emus*, with many

Hist. l. i. c.
7. Sect. 11.

Poly. histor.
c. 21.

many others, are much above this height. *Tenariffa* in the Canary Islands, is commonly related to be above 8 Miles Perpendicular, and about this height (say some) is the Mount *Perjacaca* in *America*. * Sir *Walter Rawleigh* seems to think, that the highest of these is near 30 Miles upright: *Metcor. l. nay, Aristotle* speaking of *Caucasus* in *Asia*, affirms it to be Visible for 560 Miles, as some Interpreters find by Computation; from which it will follow, that it was 78 Miles Perpendicularly high, as you may see confirmed by *Jacobus Maxenius*, and out of him in *Blancanus* the Jesuit. But this Deviates from the truth, more in Excess, than the other doth in defect. However, though these in the Moon are not so high as some amongst us; yet certain it is they are of a great height, and some of them at the least four Miles Perpendicular. This I shall prove from the Observation of *Galileus*, whose Glass can shew to the Senses a proof beyond Exception; and Certainly that Man must needs be of a most timorous Faith, who dares not beleive his own Eye.

By that Perspective you may plainly discern some Enlightened parts (which are the Mountains) to be Distant from the other about the Twentieth part of the Diameter. From whence it will follow, that those Mountains must Necessarily be at the least, four Italian Miles in height.

* *Hist. l. i. c.*
7. Sect. 11.
Metcor. l.
1. c. 11.

Comparatio div. st.
cum. Platon.
3. c. 5.
Exposit. in
lic. Math.
Arist. loc.
148.

For let BDEF be the Body of the Moon, ABC will be a Ray or Beam of the Sun, which Enlightens a Mountain at A, and B is the point of Contingency; the distance betwixt A and B, must be supposed to be the Twentieth part of the Diameter, which is an 100 Miles, for so far are some Enlightened parts severed from the common term of Illumination. Now the Aggregate of the quadrate from AB a Hundred, and BG a 1000 will be 101000; unto which the Quadrat arising from AG must be equal; according to the 47 Proposition in the first Book of Elements. Therefore

fore the whole Line AG is somewhat more than 104. and the distance betwixt HA must be above 4 Miles, which was the thing to be Proved.

But it may be again Objected, if there be such Rugged parts, and so high Mountains, why then cannot we Discern them at this distance? why doth the Moon appear unto us so exactly Round, and not rather as a Wheel with Teeth.

I Answer, by reason of too great a distance; For if the whole Body appear to our Eye so little, then those parts which bear so small a Proportion to the whole, will not at all be Sensible.

But it may be Replied, if there were any such remarkable Hills, why does not the limb of the Moon appear like a Wheel with Teeth, to those who look upon it through the great Perspective, on whose Witness you so much depend? or what Reason is there that she Appears as Exactly Round through it, as she doth to the bare Eye? Certainly then, either there is no such thing as you Imagin, or else the Glas fails much in this Discovery.

To this I shall Answer out of *Galileus*.

1. You must know that there is not merely one rank of Mountains, about the Edg of the Moon, but Divers Orders, one Mountain behind another, and so there is somewhat to hinder those Void spaces

(spaces which otherwise, Perhaps, might appear.

Now, where there be many Hills, the Ground seems even to a Man that can see the Tops of all. Thus when the Sea rages, and many vast Waves are Lifted up, yet all may appear plain enough to one that stands at the Shore. So where there are so many Hills, the Inequality will be less Remarkable, if it be Discerned at a Distance.

2. Though there be Mountains in that part which appears unto us to be the Limb of the Moon, as well as in any other place, yet the bright Vapours hide there Appearance: for there is an Orb of thick Vaporious Air that doth Immediately compass the Body of the Moon, which though it have not so great Opacity, as to terminate the Sight, yet being once Enlightened by the Sun, it doth Represent the Body of the Moon under a greater Form, and hinders our Sight from a Distinct view of her true Circumference. But of this in the next Chapter.

Somn. Astr.
not. 207.

3. *Keplar* hath Observed that in the Solary Eclipses, when the Rays may pass thorough this vaporious Air, there are some Gibbosities to be discerned in the Limb of the Moon.

I have now sufficiently proved, that there are Hills in the Moon, and hence it may seem likely, that there is also a World; for since Providence hath some special end in all

all its works, certainly then these Mountains were not produced in vain; and what more probable meaning can we conceive there should be, than to make that place convenient for Habitation?

PROP. X.

That there is an Atmo-sphaera, or an Orb of gross, Vaporious Air, Immediately encompassing the Body of the Moon.

AS that part of our Air which is nearest to the Earth, is of a thicker Substance than the other, by reason 'tis always mixed with some Vapours, which are continually exhaled into it. So is it equally requisite, that if there be a World in the Moon, that the Air about that, should be alike qualified with ours. Now, that there is such an Orb of gross Air, was first of all (for ought I can Read) Observed by *M. J. n.*, afterwards assented unto by *Keplar* and *Galilaeus*, and since by *Baptista Cijatus*, *Scheiner* with others, all of them confirming it by the same Arguments which I shall only

*Vide Euseb.
Nicom.
de Nat.
Hist. l. 2. c.*

only 11.

only Cite, and then leave this Proposition.

1. 'Tis not improbable that there should be a Sphere of grosser Air about the Moon; because 'tis Observed, that there are such kind of Evaporations which proceed from the Sun it self. For there are discovered divers movable Spots, like Clouds, that do encompass his Body: which those Authors, who have been most frequently versed in these kind of Experiments and Studies, do conclude to be nothing else but Evaporations from it. The Probability and Truth of which Observations may also be inferred from some other appearances. As,

So. A. D. 1547.
April 24.
to the 28.

1. It hath been Observed, that the Sun hath sometimes for the space of four Days together, appeared as Dull and Ruddy almost as the Moon in her Eclipses; in so much that the Stars have been seen at Mid-day. Nay, he hath been constantly darkened for almost a whole Year, and never shined, but with a kind of heavy and dusky Light, so that there was scarce heat enough to Ripen the Fruits. As it was about the time when *Cæsar* was Killed. Which was recorded by some of the Poets. Thus *Virgil*, speaking of the Sun.

Ille etiam extincto miseratus Casare Romanam.

Cum caput obscurâ nitidum ferrugine texit,

Impiaque æternam timebant sæcula noctem.

He

He pitying Rome, when as great Cæsar Did.

His Head within a Mourning-vail did hide.

And thus the Wicked Guilty World did Fright.

With doubtful Fears of an Eternal Night.

Ovid likewise speaking of his Death

-----Solis quoque tristis imago

Lurida sollicitis præbebat lumina terris.

-----The Suns sad Image then

Did yield a lowering light to Fearful Men:

Now these appearances could not arise from any lower Vapour. For then 1. They would not have been so Universal as they were, being seen through all Europe; or else 2. That Vapour must have covered the Stars as well as the Sun, which yet notwithstanding were then plainly Discerned in the Day time. You may see this Argument Illustrated in another the like case. Chap. 12. Hence then it will follow, that this Fuliginous matter, which did thus obscure the Sun, must needs be very near his Body; and if so, then, what can we more Probably guess it to be, than Evaporations from it?

2. 'Tis observed, that in the Suns total Eclipses, when there is no part of his Body discernable, yet there does not always follow so great a Darknes, as might be Expected from his total Absence. Now 'tis probable, that the Reason is, because these thicker Vapours, being Enlightned by his Beams, do convey some Light unto us, not-

notwithstanding the Interposition of the Moon betwixt his Body and our Earth.

3. This likewise is by some guesst to be the Reason of the *Crepusculum*, or that Light which we have before the Suns Rising.

Now, if there be such Evaporations from the Sun, much more then from the Moon, which does consist of a more Gross and Impure Substance. The other Arguments are taken from several Observations in the Moon herself, and do more directly tend to the proof of this Proposition.

2. 'Tis Observed, that so much of the Moon as is enlightened, is always part of a bigger Circle, than that which is darker. The frequent Experience of others hath proved this, and an easie Observation may quickly confirm it. But now this cannot proceed from any other cause so probable, as from this Orb of Air; especially when we consider how that Planet shining with a borrowed Light, doth not send forth any such Rays as may make her appearance bigger than her Body.

3. When the Moon being half Enlightened: begins to cover any Star; if the Star be towards the Obscure part, then may it by the Perspective be discerned, to be nearer unto the Center of the Moon, than the onward Circumference of the Enlightned part. But the Moon being in the

the Full; then does it seem to receive these Stars, within its Limb.

4. Though the Moon do sometimes appear the first Day of her Change, when so much as appears Enlightened, cannot be above the 80 part of her Diameter, yet then will the Horns seem at least to be of a Fingers breadth in Extension. Which could not be, unless the Air about it were Illuminated,

5. 'Tis Observed, in the Solary Eclipses, that there is some times a great Tremulation about the Body of the Moon, from which we may likewise argue an Atmosphæra, since we cannot well conceive what so probable a cause there should be of such an appearance as this, *Quod radii Solares à vapribus Lunam ambientibus fuerint intercepti*. *Scheiner. Roj. Orf. l. 4. pars 2. c. 27.* that the Sun-beams were broken and refracted by the Vapours that encompassed the Moon.

6. I may add the like Argument taken from another Observation, which will be easily tried and granted. When the Sun is Eclipsed, we discern the Moon as she is in her own natural Bigness; but then she appears somewhat less than when she is in the Full, though she be in the same place of her supposed Excentrick and Epicycle; and therefore *Tycho* hath Calculated a Table for the Diameter of the divers New Moons. But now there is no Reason so Probable, to Salve this appearance, as to place an Orb of thicker Air, near the Body

Body of that Planet, which may be Enlightened by the Reflected Beams; and through which the direct Rays may easily Penetrate.

But some may Object, that this will not consist with that which was before delivered, where I said, that the thinnest parts had least Light.

If this were true, how comes it to pass then, that this Air should be as Light as any of the others parts, when as 'tis the Thinnest of all?

I Answer, if the Light be received by Reflection only, then the thickest Body hath most, because it is best able to beat back the Rays; but if the Light be received by Illumination (especially if there be an Opacous Body behind, which may double the Beams by Reflexion) as it is here, then I deny not but a thin Body may Retain much Light, and perhaps, some of those Appearances which we take for Fiery Comets, are nothing else but a bright Cloud enlightened; So that Probable it is; there may be such Air without the Moon; and hence it comes to pass, that the greater Spots are only Visible towards her Middle parts, and none near the Circumference; not, but that there are some, as well in those parts, as elsewhere, but they are not there Perceivable, by reason of those brighter Vapours which hide them.

Prop.

PROP. XI.

That as their World is our Moon, so our World is their Moon.

I Have already handled the first thing that I Promised, according to the Method which *Aristotle* uses in his Book *de Mundo*, and shew'd you the necessary parts that belong to this World in the Moon. In the next place 'tis requisite that I proceed to those things which are Extrinsecal unto it, as the Seasons, the Meteors, and the Inhabitants.

1. Of the Seasons;

And if there be such a World in the Moon, 'tis requisite then that their Seasons should be some way Correspondent unto ours, that they should have Winter and Summer, Night and Day, as we have.

Now that in this Planet there is some Similitude of Winter and Summer, is affirmed by *Aristotle* himself, since there is, *De gen. animal. l. 4. 21.*

I

is,

Golden
Number.

is one Hemisphere that hath always Heat and Light, and the other that hath Dark-ness and Cold. True indeed, their Days and Years are always of one and the same Length (unless we make one of their Years to be 19 of ours, in which space all the Stars do Arise after the same Order.) But tis so with us also under the Poles, and therefore that great difference is not Sufficient to make it altogether unlike ours; nor can we expect that every thing there should be in the same manner as it is here below, as if Nature had no way but one to bring about her Purpose. We have no Reason then to think it necessary that both these Worlds should be altogether alike, but it may suffice if they be Cor-respondent in something only. However, it may be questioned whether it doth not seem to be against the Wisdom of Pro-vidence, to make the Night of so great a Length, when they have such a long time unfit for Work? I Answer, No; since tis so, and more with us also under the Poles; and besides, the general Length of their Night is some what abated in the Bigness of their Moon which is our Earth. For this Returns as great a Light unto that Plannet, as it Receives from it. But for the better Proof of this, I shall first free the Way from such Opinions as might otherwise hinder the speed of a clearer Progress.

*Plut. de.
fac. lunæ.*

Plutarch, one of the cheif Patrons of this World

World in the Moon, doth directly Con-tradict this Proposition, Affirming, that those who Live there, may discern our World, as the Dreggs and Sediment of all other Creatures, appeaing to them through Clouds and Foggy mists, and that altogether Devoid of Light, being Base and unmoveable; so that they might well imagine the Dark place of Damnation to be here Situate; and that they only were the Inhabiters of the World, as being in the midst betwixt Heaven and Hell.

To this I may Answer, 'tis Probable that *Plutarch* spake this Inconsiderately, and with-out a Reason, which makes him likewise fall into another Absurdity, when he says our Earth would appear Immovable; whereas Questionless, though it did not; yet would it seem to Move, and theirs to stand Still, as the Land doth to a Man in a Ship; according to that of the Poet:

*Provehimur portu, terræque urbemque rece-
dunt.*

And I doubt not but that the Ingenious Author would easily have Recanted, if he had been but acquainted with those Ex-periences which Men of latter times have found out, for the Confirmation of this Truth.

2. Unto him assents *Macrobius*; whose Words are these; *Terra accepto solis lumine clarescit tantummodo, non reducit.* "The *Somn. Scip.* Earth is by the Sun Beams made Bright, l. 1. c. 19.
I 2 "but

"but not able to Enlighten anything so far. And his Reason is, because this being of a thick and Gross Matter, the Light is Terminated in its Superficies, and cannot Penetrate into the Substance? whereas the Moon doth therefore seem so Bright to us, because it receives the Beams within it self. But the Weakness of this Assertion, may be easily Manifest by a common Experience; polished Steel (whose Opacity will not give any Admittance to the Raies) reflects a stronger Heat than Glass, and so Consequently a greater Light.

3. 'Tis the general Consent of Philosophers, that the Reflection of the Sun-Beams from the Earth doth not reach much above half a Mile high, where they Terminate the first Region, so that to Affirme they might ascend to the Moon, where to say, there were but one Region of Air, which Contradicts the proved and received Opinion.

Unto this it may be Answered:

That it is indeed the common Consent, that the Reflexion of the Sun-Beams reach only to the Second Region; but yet some there are, and those too, Philosophers of good Note, who thought otherwise. Thus Plotinus is Cited by *Cælius*, *si concipiat te in sublimi quopiam mundi loco, unde oculis subjiciatur terræ moles aquis circumfusa, & solis syderumq; radiis illustrata, non aliam profecto visam iri probabile est, quam qualis modo visatur lunaris globi species*, "If you

*Ant. lect. l.
1. c. 4.*

"con-

"conceive your self to be in some such high Place, where you might Discerne the whole Globe of the Earth and Water, when it was Enlightened by the Sun's Raies, 'tis Probable it would then Appear to you in the same Shape as the Moon doth now unto us. So *Paulus Foscarinus*. *Terra nihil aliud est quam altera Luna, vel Stella, talisq; nobis appareret, si ex convenienti elongatione eminens conspiceretur, in ipsaq; observari possent eadem aspectuum varietates, quæ in Luna apparent.* *Inepist. ad Sebast. Fanionum.* The Earth is nothing else but another Moon or Star, and would appear so unto us if it were beheld at a Convenient Distance, with the same Changes and Varieties as there are in the Moon. Thus also *Carolus Malapertius*, whose Words are these, *Terra hæc nostra, si in luna constituti essemus, splendida prorsus quasi non ignobilis planeta, nobis appareret.* *Præfat. ad Austriacæ Hyd.* "If we were placed in the Moon, and from thence beheld this Earth, it would appear unto us very Bright, like one of the Nobler Planets. Unto these doth *Fromondus* assent, when he says, *Credo equidem quod si oculus quispian in orbe lunari foret, globum terræ & aquæ instar ingentis syderis à sole illustrem conspiceret.* *Meteor. l. 1. c. 2. Art. 2.* "I beleive that this Globe of Earth and Water would appear like some great Star to any one, who should Look upon it from the Moon, Now this could not be, nor could it shine so Remarkably, unless the Beams of Light were

were Reflected from it. And therefore the same *Fromundus* expressly holds, that the first Region of Air is there Terminated, where the Heat caused by Reflexion begins to Languish, whereas the Beams themselves do pass a great way farther. The chief Argument which doth most plainly manifest this Truth, is taken from a common Observation which may be easily Tried.

If you behold the Moon a little before or after the Conjunction, when she is in a Sextile with the Sun, you may discern not only the part which is enlightened, but the rest also to have in it a kind of a dusky Light; but if you chuse out such a Situation, where some House or Chimney (being some 70 or 80 Paces distant from you) may hide from your Eye the enlightened Hornes, you may then discern a greater and more remarkable shining in those parts unto which the Sun-Beams cannot reach; nay there is so great a Light, that by the help of a good perspective you may discern its Spots. In so much that *Blancanus* the Jesuit speaking of it, says,

De mundi fab. p. 3.
2. 3. *Hæc experientia ita me aliquando fefellit, ut in hunc fulgorem casu ac repente incidens, existimarim novo quodam miraculo tempore adolescentis lunæ factum esse plenilunium.* "This Experiment did once so deceive me, that "happening upon the sight of this brightness upon a sudden, I thought that by "some new miracle the Moon had been

"got

"got into her Full a little after her "change.

But now this Light is not proper to the Moon; it doth not proceed from the Rays of the Sun which doth penetrate her Body, nor is it caused by any other of the Planets and Stars. Therefore it must necessarily follow, that it comes from the Earth. The two first of these I have already proved, and as for the last, it is confidently affirmed by *Cælius*, *Quod si in disquisitionem evocet quis, an lunari syderi lucem fœnerent planetæ item alii, asseveranter astruendum non fœnerare.* "If any should ask whether the "other Planets lend any Light to the "Moon? I answer, they do not. True indeed, the Noble *Tycho* discussing the reason of this Light, attributes it to the Planet *Venus*; and I grant that this may convey some Light to the Moon; but that it is not the cause of this whereof we now Discourse, is of it self sufficiently plain, because *Venus* is sometimes over the Moon, when as she cannot convey any Light to that part which is turned from her.

It doth not proceed from the fixed Stars; for then it would retain the same Light in Eclipses, whereas the Light at such times is more Ruddy and Dull. Then also the Light of the Moon would not be greater or lesser, according to its distance from the Edge of the Earths shadow, since it did at all times equally participate this Light of the Stars.

Ant. Lect.
l. 20. c. 5.

Progym. 1.

In brief, this is neither proper to the Moon, nor does it proceed from any Penetration of the Sun's Raies, or the shining of *Venus*, or the other Planets, or the fixed Stars. Now because there is no other Body in the whole Universe, save the Earth, it remains that this Light must necessarily be caused by that, which with a Just Gratitude repaies to the Moon such Illumination as it receives from her.

And as Loving Friends, equally Participate of the same Joy and Grief, so do these Mutually partake of the same Light from the Sun, and the same Darkness from the Eclipses, being also severally helped by one another in their greatest wants: For when the Moon is in Conjunction with the Sun, and her upper part receives all the Light, then her lower Hemisphere (which would otherwise be altogether dark) is enlightened by the Reflexion of the Sun-Beams from the Earth. When these two Planets are in Opposition, then that part of the Earth which could not receive any Light from the Sun-Beams, is most enlightened by the Moon, being then in her Full; and as she doth most Illuminate the Earth when the Sun-Beams cannot, so the grateful Earth Returns to her as great (nay greater) Light when she most wants it; so that always that visible part of the Moon, which receives nothing from the Sun, is enlightened by the Earth, as is proved by *Galilæus*, with many more Arguments,

guments, in that Treatise which he calls *Systema mundi*. True indeed, when the Moon comes to a quartile, then you can neither discern this Light, nor yet the darker part of her Body, and that for a double reason.

1. Because the nearer it comes to the Full, the less Light does it receive from the Earth, whose Illumination does always decrease in the same Proportion as the Moon does Increase.

2. Because of the Exuperancy of the Light in the other parts. *Quippe illustratum medium speciem recipit valentior*, the clearer brightness involves the weaker, it being with the Species of Sight, as it is with those of Sound; and as the greater Noise drowns the less, so the brighter Object hides that which is more obscure. But as they do always in their Mutual Vicissitudes participate of one anothers Light; so also do they partake of the same Defects and Darkenings; for when our Moon is Eclipsed, then is their Sun darkened; and when our Sun is Eclipsed, then is their Moon deprived of its Light, as you may see affirmed by *Messin*. *Quod si terram nobis ex alto liceret intueri, quemadmodum deficientem lunam ex longinquo spectare possumus, videremus tempore Eclipsis solis terræ aliquam partem lumine solis deficere, eodem plane modo sicut ex opposito luna deficit.* "If we might behold this Globe of Earth at the same distance, as we do the Moon in her Defect, we might

Scal. exerc. 62.

Epir. Astr. l. 4. part. 2.

118 *That the Moon may be a World.*

" might discern some part of it darkened
 " in the Suns Eclipses, just so as the Moon
 " is in hers. For as our Moon is Eclipsed
 by the Interposition of our Earth, so is their
 Moon Eclipsed by the Interposition of theirs.
 The manner of this Mutual Illumination be-
 twixt these two you may plainly discern in
 this Figure following.

Where

That the Moon may be a World. 119

Where A represents the Sun, B the Earth, and C the Moon; Now suppose the Moon C to be in a Sextile of Increase, when there is only one small part of her Body Enlightened, then the Earth B will have such a part of its visible Hemisphere darkened, as is Proportionable to that part of the Moon which is Enlightened; and as for so much of the Moon, as the Sun-Beams cannot reach unto, it receives Light from a Proportional part of the Earth which shines upon it, as you may plainly perceive by the Figure.

You see then that Agreement and Similitude which there is betwixt our Earth and the Moon. Now the greatest difference which makes them unlike, is this, that the Moon enlightens our Earth round about, whereas our Earth gives Light only to that Hemisphere of the Moon which is visible unto us, as may be certainly gathered from the constant appearance of the same Spots, which could not thus come to pass, if the Moon had such a Diurnal Motion about its own Axis as perhaps our Earth hath. And though some suppose her to move in an Epicycle, yet this doth not so turn her Body Round, that we may discern both Hemispheres; for according to that Hypothesis (say they) the Motion of her Eccentrick doth turn her Face towards us, as much as the other doth from us.

But now, if any Question what they do

do for a Moon who Live in the upper part of her Body? I Answer, the solving of this, is the most uncertain and difficult thing that I know of, concerning this whole matter. But yet unto me this seems a probable Conjecture.

That the upper Hemisphere of the Moon doth receive a Sufficient Light from those Planets about it; and amongst these, *Venus* (it may be) bestows a more especial brightness, since *Galileus* hath plainly discerned that she suffers the same increases and decreases, as the Moon hath, and 'tis probable that this may be perceived there, without the help of a Glass, because they are far nearer it, than we. When *Venus* (saith *Keplar*) lies down in the Perige or lower part of her supposed Epicycle, then is she in Conjunction with her Husband the Sun, from whom after she hath departed for the space of Ten Months, she gets *plenum uterum*, and is in the Full.

But you'll reply, though *Venus* may bestow some Light when she is over the Moon, and in Conjunction, yet being in Opposition she is not visible to them, and what shall they then do for Light?

I Answer, then they have none, nor doth this make so great a Difference betwixt those two Hemispheres, as there is with us, betwixt the places under the Poles, and the Line. And besides, 'tis
Con-

Considerable, that there are two kind of Planets.

1. Primarie, such whose proper Circles do encompass the Body of the Sun, whereof there are Six. *Saturne, Jupiter, Mars, Ceres, or the Earth, Venus, Mercury.* As in the Frontispice.

2. Secondary, such whose proper Circles are not about the Sun, but some of the other Primarie Planets. Thus are there two about *Saturne*, four about *Jupiter*, and thus likewise does the Moon encompass our Earth. Now tis Probable that these lesser, Secondary Planets, are not so accommodated with all Conveniencies of Habitation, as the others that are more Principal.

*De doct. ig.
l. 3. c. 12.*

But it may seem a very Difficult thing to Conceive, how so Gross and Dark a Body as our Earth, should yeild such a clear Light as Proceeds from the Moon; and therefore the Cardinal *de Cusa* (who thinks every Star to be a several World) is of Opinion, that the Light of the Sun is not able to make them appear so Bright; but the reason of their shining is, because we behold them at a great Distance through their Regions of Fire which do set a shining Lustre upon those Bodies that of themselves are Dark. *Unde si quis esset extra regionem ignis, terra ista in circumferentia sue regionis per medium ignis lucida stella appareret.* "So that, if a Man were beyond
"the Region of Fire, this Earth would

ap-

"appear through that, as a bright Star. But if this were the only Reason, then would the Moon be freed from such Increases and Decreases as she is now lyable unto.

Keplar thinks that our Earth receives that Light whereby it shines, from the Sun, but this (saith he) is not such an intended clear Brightness as the Moon is capable of, and therefore he guesses, that the Earth there, is of a more Chokie soyl, like the Isle of *Crete*, and so is better able to Reflect a stronger Light, whereas our Earth must supply this Intention with the quantity of its Body. But this I Conceive to be a needless Conjecture, since our Earth, if all things were well Considered, will be found able enough to Reflect as great a Light. For,

1. Consider its Opacity; if you mark these Sublunary things, you shall perceive that amongst them, those that are most Perspicuous, are not so well able to Reverberate the Sun-Beams, as the thicker Bodies. The Rays pass singly through a Diaphanous matter, but in an Opacous substance they are doubled in their Return, and Multiplied by Reflexion. Now if the Moon and the other Planets can shine so Clearly by beating back the Sun-Beams, why may not the Earth also shine as well, which agrees with them in the cause of this Brightness their Opacity?

2. Con-

2. Consider what a clear Light we may Discern Reflected from the Earth in the midst of Summer, and withall Conceive how much Greater that must be which is under the Line, where the Raies are more Directly and Strongly Reverberated.

3. 'Tis Considerable that though the Moon does in the Night time seem to be of so clear a Brightness, yet when we look upon it in the Day, it appears like some little, whitish Cloud: Not but that at both times, she is of an equal Light in her self. The Reason of this Difference is, because in the Night we look upon it through a Dark and Obscure *medium*, there being no other Enlightened Body, whose Brightness may Abate from this: Whereas in the Day time, the whole Heavens round about it, are of an equal Clearness, and so make it to appear with a weaker Light. Now because we cannot see how the Enlightened parts of our Earth do look in the Night, therefore in comparing it with the Moon, we must not Consider her, as she is beheld through the Advantage of a Dark *Medium*, but as she seems in the Day-time: Now, in any clear Sun-shine Day, our Earth does appear as Bright as the Moon, which at the same time does seem like some dusky Cloud (as any little Observation may easily Manifest.) Therefore we need not doubt but that the Earth is as well able to give Light, as the Moon. To this, it may be added, that those

those very Clouds, which in the Day-time seem to be of an equal Light to the Moon, do in the Evening become as Dark as our Earth; and as for those of them, which are looked upon at any great Distance, they are often Mistaken for the Mountains.

4. 'Tis Considerable, that though the Moon seem to be of so great a Brightness in the Night, by reason of its nearness unto those several shadows which it casts, yet is it of it self Weaker than that part of Twilight, which usually we have for half an Hour after Sun-set, because we cannot, till after that time, Discern any shadow to be made by it.

5. Consider the great Distance at which we behold the Planets, for this must needs add much to their Shining; and therefore *Cusanus* (in the above cited Place) thinks, that if a Man were in the Sun, that Planet would not appear so Bright to him, as now it doth to us, because then his Eye could discern but little, whereas here, we may Comprehend the Beams as they are Contracted in a narrow Body. *Keplar* beholding the Earth from a high Mountain, when it was Enlightened by the Sun, Confesses, that it appeared unto him of an incredible Brightness, whereas then he could only see some small parts of it; but how much Brighter would it have appeared if he might in a direct Line behold the whole Globe of Earth, and these Rays

K

gathered

gathered together! So that if we Consider that great Light which the Earth receives from the Sun in the Summer, and then Suppose we were in the Moon, where we might see the whole Earth hanging in those vast Spaces, where there is nothing to Terminate the Sight, but those Beams which are there Contracted into a little Compass; I say, if we do well Consider this, we may easily Conceive that our Earth appears as Bright to those other Inhabitants in the Moon, as theirs doth to us.

But here it may be Objected, that with us. for many Days in the Year, the Heavens are so overcrowded, that we cannot see the Sun at all, and for the most part, in our brightest Days, there are many scattered Clouds which shade the Earth in sundry Places; so that in this Respect, it must needs be unlike the Moon and will not be able to yeild so clear, unintermitted a Light, as it Receives from that Planet;

To this I Answer.

1. As for those lesser brighter Clouds which for the most part are Scattered up and down in the clearest Days, these can be no Reason why our Earth should be of a Darker appearance, because these Clouds being near unto the Earth, and so not Distinguishable at so great a Distance from it, and likewise being Illuminated on their back Parts by the Sun that

that shines upon them, must seem as Bright to those in the Moon, as if the beams were Immediately Reflected from our Earth.

2. When these Clouds that are Interposed, are of any large Extention or great Opacity, as it is in Extraordinary lasting and great Rains, then there must be some Discernable alterations in the Light of our Earth; But yet this does not make it to Differ from the Moon: since it is so also with that Planet, as is shewed in the later part of the next Chapter.

PROP. XII.

*That 'tis Probable there may be such
 Meteors belonging to that World in
 the Moon, as there are with us.*

Plutarcb Discussing this Point, Affirms, that it is not necessary there should be the same means of Growth and Fructifying in both these Worlds, since Nature might in her Policy find out more ways than one, how to bring about the same Effect. But however, he thinks it is Probable, that the Moon her self sendeth forth warm Winds, and by the Swiftnes of her Motion, there should breath out a Sweat and Comfortable Air, Pleasant Dews, and gentle Moisture, which might serve for Refreshing and Nourishment of the Inhabitants and Plants in that other World.

But since they have all things alike with us, as Sea and Land, and Vaporous Air
 En.

Encompassing both, I should rather therefore think, that Nature there should use the same way of Producing Meteors, as she doth with us (and not by a Motion, as Plutarcb Supposes,) because she doth not love to Vary from her usual Operations without some Extraordinary Impediment, but still keeps her Beaten Path, unless she be Driven thence.

One Argument whereby I shall Manifest this Truth, may be taken from those new Stars which have appeared in Divers Ages of the World, and by their Paralax, have been Discerned to have been above the Moon, such as was that in *Cassiopeia*, that in *Sagittarius*, with many others betwixt the Plannets. Hipparchus in his time took Especial notice of such as these, and therefore Fancied out such Constellations, in which to place the Stars, shewing how many there were in every Asterism, that so afterwards, Posterity might know, whether there were any new Star Produced, or any old one Missing. Now the Nature of these Comets may Probably Manifest, that in this other World there are other Meteors also; for these in all likelihood are nothing else, but such Evaporations caused by the Sun, from the Bodies of the Plannets. I shall Prove this, by shewing the Improbabilities and Inconveniences of any other Opinion.

For the better pursuit of this, 'tis in the first place requisite, that I deal with our

chief adversary, *Cæsar la Galla*, who doth most directly oppose that Truth which is here to be proved: He endeavouring to confirm the Incorruptibility of the Heavens, and being there to satisfy the Argument which is taken from these Comets, he Answers it thus: *Aut argumentum desumptum ex paraxi, non est efficax, aut si est efficax, eorum instrumentorum usum decipere, vel ratione astri, vel medii, vel distantia; aut ergo erat in suprema parte aeris, aut si in calo, tum forsan factum erat ex reflecteone radiorum Saturni & Iovis, qui tunc in Coniunctione fuerant.* "Either the Argument from the Parallax is not Efficacious, or if it be, yet the use of the Instruments might deceive, either in regard of the Star, or the Medium, or the distance, and so this Comet might be in the upper Regions of the Air; or if it were in the Heavens, there it might be produced by the Reflection of the Rays from *Saturn* and *Jupiter*, who were then in Conjunction. You see what shifts he is driven to, how he runs up and down to many Starting Holes, that he may find some shelter; and in stead of the strength of reason, he Answers with a Multitude of Words, thinking (as the Proverb is) that he may use Hail, when he hath no Thunder. *Nihil turpius* (saith *Seneca) *dubio & incerto, pedem modo referente, modo producente.* "What can there be more unseemly in one that should be a fair disputant, than to be now here, now there, and

* Epist. 95.

"and so uncertain, that one cannot tell where to find him? He thinks that there are not Comets in the Heavens, because there may be many other reasons of such appearances; but what he knows not; perhaps (he says) that Argument from the Parallax is not sufficient, or if it be, then there may be some deceit in the Observation. To this I may safely say, that he may justly be accounted a weak Mathematician who mistrusts the strength of this Argument; nor can he know much in Astronomy, who understands not the Parallax which is a Foundation of that Science; and I am sure that he is a Timorous Man, who dares not believe the frequent Experience of his Senses, or trust to a Demonstration.

True indeed, I grant 'tis possible, that the Eye, the Medium, and the distance may all deceive the beholder; but I would have him shew which of all these was likely to cause an Errour in this Observation? Meerly to say they might be deceived, is no sufficient Answer; for by this I might confute the positions of all Astronomers, and Affirm the Stars are hard by us, because 'tis possible they may be deceived in their Observing distance. But I forbear any further reply; my Opinion is of that Treatise, that either it was set forth purposely to tempt a Confutation, that he might see the Opinion of *Galileus* confirmed by others, or else it was invented with as much hast and Negligence as it was Printed, there

Vide Galileum. Syst. mundi. col. log. 3.

being in it, almost as many Faults as Lines.

Others think, that these are not any new Comets, but some Ancient Stars that were there before, which now shine with that unusual brightness, by reason of the Interposition of such Vapours, which do Multiply their Light; and so the Alteration will be here only, and not in the Heavens. Thus *Aristotle* thought the appearance of the Milky way was produced. For he held, that there were many little Stars, which by their Influence did constantly attract such a Vapour towards that place of Heaven, so that it always appeared white. Now by the same reason, may a brighter Vapour be the cause of these appearances.

But how probable soever this Opinion may seem, yet if well considered, you shall find it to be altogether absurd and impossible: for,

1. These Stars were never seen there before, and 'tis not likely, that a Vapour being hard by us, can so multiply that Light, which could not before be at all discerned.

2. This supposed Vapour cannot be either contracted into a narrow compass, or dilated into a broad. 1. It could not be within a little Space, for then that Star would not appear with the same Multiplied Light to those in other Climates. 2. It cannot be a dilated Vapour, for then other Stars which were discerned through the same Vapour, would seem as big as that; this

Ar-

Argument is the same in Effect, with that of the Parallax, as you may see in this Figure.

Suppose A B to be a Hemisphere of one Earth, C D to be the upper part of the highest Region, in which there might be either a contracted Vapour, as G, or else a dilated one, as H I. Suppose E F likewise to represent half the Heavens, wherein was this appearing Comet at K. Now I say, that a contracted Vapour, as G, could not cause this appearance, because an Inhabitant at M could not discern the same Star with the brightness, but perhaps another at L, betwixt which the Vapour is directly interposed. Nor could it be caused

by

by a dilated Vapour, as H I, because then all the Stars that were discerned through it, would be perceived with the same brightness.

'Tis necessary therefore that the cause of this appearance should be in the Heavens. And this is granted by the most and best Astronomers. But, say some, this doth not Argue any Natural Alteration in those purer Bodies, since 'tis probable that the Concourse of many little Vagabond Stars, by the Union of their Beams may cause so great a Light. Of this Opinion were *Anaxagoras* and *Zeno* amongst the Ancient, and *Baptista Cistatus*, *Blancanus*, with others amongst our Modern Astronomers. For, say they, when there happens to be a Concourse of some few Stars, then do many other Fly unto them from all the parts of Heaven like so many Bees unto their King. But 1. 'Tis not likely that amongst those which we Count the fixed Stars, there should be any such uncertain Morions, that they can wander from all parts of the Heavens, as if Nature had neglected them, or forgot to appoint them a Determinate Course. 2. If there be such a Conflux of these, as of Bees to their King, then what reason is there, that they do not still tarry with it, that so the Comet may not be dissolved? But enough of this. You may commonly see it Confuted by many other Arguments. Others there are, who affirm these to be some new Created Stars, pro-

*Clavius in
Sphaeram.
cap. I.*

produced by an extraordinary Supernatural Power. I answer, true indeed, 'tis possible they might be so, but however, 'tis not likely they were so, since such appearances may be saved some other way; wherefore to Fly unto a Miracle for such things, were a great Injury to Nature, and to derogate from her skill; an Indignity much misbecoming a Man who professes himself to be a Philosopher. *Miraculum (saith one) est ignorantiae Asylum*, a •Miracle often serves for the Recepracle of a lazy Ignorance; which any industrious Spirit would be ashamed of, it being but an idle way to shift off the Labour of any further search. But here's the misery of it, we first tye our selves unto *Aristotles* Principles, and then conclude that nothing could contradict them, but a Miracle; whereas 'twould be much better for the Common-Wealth of Learning, if we would ground our Principles rather upon the frequent Experiences of our own, than the bare Authority of others.

Some there are who think, that these Comets are nothing else, but Exhalations from our Earth, carryed up into the higher parts of the Heaven. So *Peno*, *Rotb-Tycho Pro-*
mannus & *Galilaus*. But this is not possible, *gym. l. 1. c. 9.* since by Computation 'tis found, that one of them is above 300 times bigger than the whole Globe of Land and Water. Others therefore have thought that they did proceed from the Body of the Sun, and that Plan-

Plannet only is *Cometarum officina*, unde tanquam emissarii & exploratores emanitterentur brevi ad solem redituri: The Shop or Forge of Comets from whence they were sent, like so many Spies, that they might in some short space return again. But this cannot be, since if so much matter had proceeded from him alone, it would have made a sensible Diminution in his Body. The Noble *Tycho* therefore thinks, that they consist of some such Fluid parts of the Heaven, as the Milky way is framed of, which being condensed together, yet not attaining to the consistency of a Star, is in some space of time rarified again into its wonted Nature. But this is not likely; because the appearance of the Milky way does not arise from some Fluid parts of the Heaven (as he supposes) but from the Light of many lesser Stars which are thereabouts. And therefore it is usually thus described.

*Fromond.
Meteor.
l. 2. c. 5.
art. 2.*

*Item Vesta
tract. 5. c. 2.* *Via lactea nihil aliud est quam innumerabiles stellarum fixarum greges qui confuso & pallenti lumine tractum illum inalbant.* The Milky way is nothing else but the Pale and Confused Light of many lesser Stars, whereby some parts of the Heaven are made to appear white.

And beside, what likely cause can we conceive of this Condensation, unless there be such qualities there, as there are in our Air, and then, why may not the Plannets have the like qualities as our Earth? and if so, then 'tis more probable, that they are made

made by the Ordinary way of Nature, as they are with us, and consist of such Exhalations from the Bodies of the Plannets, as being very much rarified, may be drawn up, through the Orb of gross Vaporous Air, that encompasses them. Nor is this a singular Opinion; but it seemed most likely to *Camillus Gloriosus. Th. Campanella, De Comet. Fromondus*, with some others. But if you ask, whither shall all these Exhalations return? I answer, every one into his own Plannet. If it be again Objected, that then there will be so many Centers of Gravity, and each several Plannet will be a distinct World; I reply, we have not like probability concerning the rest; but yet, perhaps all of them are so, except the Sun, though *Cusanus*, and some others, think, there is one also; and later times have discovered some lesser Clouds moving round about him. But as for *Saturn*, he hath two Moons on each side. *Jupiter* hath four, that incircle him with their Motion. Which are likewise Eclipsed by the Interposition of his Body, as the Moon is by our Earth. *Venus* is Observed to increase and decrease as the Moon. And this perhaps hath been noted by former Ages, as may be guess by that Relation of *Saint Austin* out of *Varro. Mars*, and all the rest, derive their Light from the Sun. Concerning *Mercury*, there hath been little or no Observation, because, for the most part, he lies hid under the Sun-Beams, and seldom appears by himself. But when he

cap. 8.*

he does, yet the compass of his Body is so little, and his Light of so clear a brightness, by reason of his nearness to the Sun, that the Perspective cannot make the same Discoveries upon him, as from the Rest.

So that if you Consider their Quantity, their Opacity, or these others Discoveries, you shall find it probable enough, that each of them may be a several World. Especially, since every one of them is allotted to a several Orbe, and not altogether in one, as the fixed Stars seem to be. But this would be too much for to Vent at the first: the Chief thing at which I now aim in this Discourse, is to Prove that there may be one in the Moon.

It hath been before Confirmed, that there was a Sphear of thick Vaporous Air Encompassing the Moon, as the First and Second Regions do this Earth. I have now shewed, that thence such Exhalations may Proceed as do Produce the Comets: Now from hence it may Probably follow, that there may be Wind also & Rain, with such other Meteors, as are common amongst us. This Consequence is so Dependant, that *Fromondus* dares not deny it, though he would (as he Confesses himself;) for if the Sun be able to Exhale from them such Fumes as may cause Comets, why not such as may cause Winds, why not then such also as may cause Rain, since I have above shewed, that there is Sea and Land, as with us?

Now

*De meteor.
l. 3. c. 2.
Art. 6.*

Now, Rain seems to be more Especially Requisite for them, since it may allay the Heat and Scorplings of the Sun, when he is over their Heads. And Nature hath thus Provided for those in Peru, with the other Inhabitants under the Line.

But if there be such great, and Frequent Alterations in the Heavens, why cannot we Discern them?

I Answer :

1. There may be such, and we not able to Perceive them, because of the Weakness of our Eye, and the Distance of those places from us; they are the Words of *Fiennus* (as they are quoted by *Fromondus* in the above cited place) *possunt maximæ permutationes in cælo fieri etiamsi a nobis non conspiciantur; hoc visus nostri debilitas & immensa cæli distantia faciunt.* And unto him Assents *Fromondus* himself, when a little after he sayes, *Si in sphaeris planetarum degeremus, plurima forsan cælestium nebularum vellera toto æthere passim dispersa videremus, quorum species jam evanescit nimia spatii intercapedine.* "If we did live in the Sphears of the Planets, we might there perhaps Discern many great Clouds "Dispersed through the whole Heavens, which are not now Visible by Reason of this great Distance.

2. *Mæssin* and *Keplar* Affirme, that they have seen some of these Alterations. The Words of *Mæssin* are these (as I find them Cited.) *In eclipsi lunari vespere Dominicæ Pal-*

nota
ultima.

Palmarum Anni 1605. in corpore Lunæ versus Boream, nigricans quædam macula conspecta fuit, obscurior cætero toto corpore, quedæ candentis ferri figuram representabat; dixisses nubila in multam regionem extensa pluviis & tempestuosus imbribus gravida, cujusmodi ab excelsorum montium jugis in humiliora convallium loca videre non rard contingit. "In that Lunary Eclipse which happened in the Even of Palm-Sunday, "in the Year 1605, there was a certain "Blackish Spot discerned in the Northerly "part of the Moon, being Darker than "any other place of her Body, and Representing the Colour of Red Hot Iron; "You might Conjecture that it was "some Dilated Cloud, being Pregnant "with Showers; for thus do such lower "Clouds appear from the Tops of high "Mountains.

And a little before this Passage, the same Author speaking of that Vaporious Air about the Moon, tells us. *Quid circumflans ille splendor diversis temporibus apparet limpidior plus minusve.* That it does at divers times appear of a Different Clearness, sometimes more, and sometimes less; which he Guessees to arise from the Clouds and Vapours that are in it.

Unto this I may add another Testimony of Bapt. Cistatus, as he is Quoted by Nicrembergius, Grounded upon an Observation taken 23 Years after this of Messin, and Writ to this Ensch. Nicremberg. in a Letter

Letter by that Diligent and Judicious Astronomer. The Words of it Run thus; *Hist. nat. l. 2. c. 11.* Et quidem in eclipsi nupera solari quæ fuit ipso die natali Christi, observavi clare in luna soli supposita, quidpiam quod valde probat id ipsum quod Cometæ quoque & maculæ solares urgent, nempe cælum non esse à tenuitate & variationibus aeris exemptum; nam circa lunam adverti esse sphaeram seu orbem quendam vaporosum, non secus atque circum terram, adeoque sicut ex terra in aliquam usque sphaeram vapores & exhalationes expirant, ita quoque ex luna. "In that late Solary Eclipse which happened on Christmas Day, "when the Moon was just under the Sun, "I plainly Discerned that in her, which may "clearly Confirm what the Comets and "Suns Spots do seem to Prove, viz. that "the Heavens are not so Solid, nor Freed "from those Changes which our Air is "liable unto; for, about the Moon I Perceived such an Orb, or Vaporious Air, "as that is which doth Encompass our "Earth; and as Vapours and Exhalations are raised from our Earth into "this Air, so are they also from the "Moon.

You see what Probable Grounds, and plain Testimonies I have brought for the Confirmation of this Proposition: many other things in this behalf might be Spoken, which for Brevity sake I now Omit, and Pass unto the Next.

L

PROP.

PROP. XIII.

That tis Probable there may be Inhabitants in this other World, but of what kind they are, is Uncertain.

I Have already Handled the Seasons, and Meteors belonging to this New World: tis Requisite that in the next place, I should come unto the Third thing which I Promised, and say somewhat of the Inhabitants; Concerning whom there might be many Difficult Questions raised; as, whether that place be more Inconvenient for Habitation than our World (as *Keplar* thinks;) whether they are the Seed of *Adam*, whether they are there in a Blessed Estate, or else what means there may be for their Salvation? with many other such Uncertain Enquires, which I shall willingly Omit, leaving it to their Examination who have more Leisure and Learning

Learning, for the Search of such Particulars.

Being for mine own part Content only to set down such Notes belonging unto these, which I have Observed in other Writers. *Cum tota illa regio nobis ignota sit, remanent inhabitatores illi ignoti penitus* (saith *Cusanus*) since we know not the Regions of that place, we must be altogether Ignorant of the Inhabitants There hath not yet been any such Discovery Concerning these, upon which we may Build a Certanty, or good Probability: well may we Guess at them, and that too very Doubtfully, but we can know nothing; for, if we do hardly guess aright at things which be upon Earth, if with Labour we do find the things that are at Hand, How then can we Search out those things that are in Heaven? What a Little is that which we know, in Respect of those many Matters Contained within this great Universe? This whole Globe of Earth and Water, though it seem to us to be of a Large Extent, yet it Bears not so great a Proportion unto the whole Frame of Nature, as a small Sand doth unto it; and what can such little Creatures as we, Discern, who are Tied to this Point of Earth? or what can they in the Moon know of us? If we understand any thing (saith *Esdras*) 'tis nothing but that which is upon the Earth; 2 *Esdr.* 4. and he that Dwelleth above in the Heavens, 21.

may only Understand the things that are above in the Height of the Heavens.

So that 'twere a very Needless thing for us to Search after any Particulars; however, we may Guess in the General that there are some Inhabitants in that Planner: for why else did Providence Furnish that place with all such Conveniences of Habitation as have been above Declared?

But you will say, perhaps; is there not too great and Intolerable a Heat, since the Sun is their Zenith every Month, and doth tarry there so long before he Leaves it?

I Answer,

1. This may, Perhaps, be Remedied (as it is under the Line) by the Frequency of Mid-Day Showers, which may Cloud their Sun, and Cool their Earth.

2. The Equality of their Nights doth much Temper the Scorching of the Day; and the Exream Cold that comes from the one, Requires some space before it can be Dispelled by the other, so that the Heat Spending a great while before it can have the Victory, hath not afterwards much time to Rage in. Wherefore notwithstanding this Doubt, yet that place may Remain Habitable. And this was the Opinion of the *Cardinal de Cusa*, when speaking of this Planet, he says, *Hic locus Mundi est habitatio hominum & animalium*

*De doct.
ign. l. 2.
c. 12.*

malium atque vegetabilium. "This part of the World is Inhabited by Men, and Beasts, and Plants. To him Assented *Campanella*; but he cannot Determine whether they were Men or rather some other kind of Creatures. If they were Men, then he thinks they could not be Infected with *Adams Sin*; yet Perhaps, they had some of their own, which might make them liable to the same Misery with us, out of which, it may be, they were Delivered by the same means as we, the Death of Christ; and thus he thinks that place of the *Ephesians* may be Interpreted, where the Apostle says, *God gathered all things together in Christ, both which are in Earth, and which are in the Heavens:* ^{*Ephes. 1. 10.*} So also that of the same Apostle to the *Colossians*, where he says, that it Pleased the Father to Reconcile all things unto himself ^{*Col. 1. 20.*} by Christ, whether they be things in Earth, or things in Heaven.

But I Dare not jest with Divine Truths, or apply these places according as fancy Directs. As I think this Opinion doth not any where Contradict Scripture: so I think likewise, that it cannot be Proved from it. Wherefore *Campanella's* Second Conjecture may be more Probable, that the Inhabitants of that World, are not Men as we are, but some other kind of Creatures which Bear some Proportion, and Likeness to our Natures. Or it may be, they are of a quite Different Nature

from any thing here Below, such as no Imagination can Describe; our Understandings being Capable only of such things as have Entered by our Senses, or else such Mixed Natures as may be Composed from them. Now, there may be many other Species of Creatures beside those that are already known in the World; there is a great Chasme betwixt the Nature of Men and Angels; It may be the Inhabitants of the Planets are of a Middle Nature between both these. 'Tis not Improbable that God might Create some of all Kinds, that so he might more Compleatly Glorifie himself in the Works of his Power and Wisdom.

Cusanus too, thinks they differ from us in many respects; I will set down his words as they may be found in the above Cited place, *Suspiciamur in regione solis magis esse solares, claros & illuminatos intellectuales habitatores, spiritualiores etiam quàm in luna, ubi magis lunatici, & in terra magis materiales & crassi, ut illi intellectualis naturæ solares sint multum in actu & parum in potentia, terreni verò magis in potentia, & parum in actu, lunares in medio fluctuantes. Hoc quidem opinamur ex influentia ignis solis, aquatica simul & aerea lune, & gravidine materiali terræ, & consimiliter de aliis stellarum regionibus, suspicantes nullam habitationibus carere, quasi sit partes particulares mundiales unius universi, quot sunt stellæ quærum non est numerus,*

numerus, nisi apud eum qui omnia in numero creavit.

"We may Conjecture (saith he) the
"Inhabitants of the Sun are like to the
"Nature of that Plannet, more clear and
"bright, more Intellectual than those in
"the Moon where they are nearer to the
"Nature of that duller Plannet, and those
"of the Earth being more gross and material than either, so that these Intellectual
"Natures in the Sun, are more form than
"matter, those in the Earth more matter
"than form, and those in the Moon betwixt
"both. This we may guess from the fiery
"Influence of the Sun, the Watery and
"Aereous Influence of the Moon, as also
"the Material Heaviness of the Earth. In
"some such manner likewise is it with the
"Regions of the other Stars; for, we
"Conjecture that none of them are without
"Inhabitants, but that there are so
"many particular Worlds and parts of
"this one Universe, as there are Stars,
"which are innumerable, unless it be to
"him who Created all things in Number.

For he held that the Stars were not all in one equal Orb as we commonly suppose; but that some were far higher than others, which made them appear less; and that many others were so far above any of these, that they were altogether invisible unto us. An Opinion which (as I conceive)

ceive) hath not any great probability for it, nor certainty againſt it.

The Preiſt of *Saturn* relating to *Plutarch* (as he feigns it) the Nature of theſe Selenites, told him, they were of divers diſpoſitions, ſome deſiring to live in the lower parts of the Moon, where they might look downwards upon us, while others were more ſurely mounted aloft, all of them ſhining like the Rays of the Sun, and as being Victorious, are Crowned with Garlands made with the Wings of *Euthia* or *Conſtancie*.

It hath been the Opinion amongſt ſome of the Ancients, that their Heavens and Elyſian Fields were in the Moon where the Air is moſt quiet and pure. Thus *Socrates*, thus *Plato*, with his followers, did eſteem this to be the place where thoſe purer Souls Inhabite, who are freed from the Sepulcher, and Contagion of the Body. And by the Fable of *Ceres*, continually wandring in ſearch of her Daughter *Proſerpina*, is meant nothing elſe but the longing deſire of Men, who live upon *Ceres* Earth, to attain a place in *Proſerpina*, the Moon or Heaven.

Plutarch alſo ſeems to aſſent unto this; but he thinks moreover, that there are two places of happineſſs anſwerable to thoſe two parrs which he Fancies to remain of a Man when he is Dead, the Soul and the Underſtanding; the Soul he thinks is made of the Moon; and as our Bodies do ſo proceed

ceed from the duſt of this Earth, that they ſhall return to it hereafter; ſo our Souls were generated out of that Planet, and ſhall be reſolved into it again; whereas the underſtanding ſhall aſcend unto the Sun, out of which it was made, where it ſhall poſſeſs an Eternity of well-being, and far greater happineſſs than that which is enjoyed in the Moon. So that when a Man Dies, if his Soul be much polluted, then muſt it wander up and down in the middle Region of the Air, where Hell is, and there Suffer unſpeakable Torments for thoſe Sins whereof it is Guilty. Whereas the Souls of better Men, when they have in ſome Space of time been purged from that impurity which they did derive from the Body, then do they return into the Moon, where they are poſſeſt with ſuch a joy, as thoſe Men feel who profeſs holy Myſteries, from which place (ſaith he) ſome are ſent down to have the Superintendence of Oracles, being diligent either in the Preſervation of the good, either from, or in, all Perills, and the Prevention or Punishment of all Wicked Actions; but if in theſe Employments they miſ-behave themſelves, then are they again to be imprifoned in a Body, otherwiſe they remain in the Moon, till their Souls be reſolved into it; and the underſtanding being cleared from all Impediments, aſcends to the Sun which is its proper place. But this requires a diverſe Space of time, according to the divers Affections

fections of the Soul. As for those who have been Retired and Honest, addicting themselves to a Studious and quiet Life, these are quickly preferred to a higher Happiness. But as for such who have busied themselves in many Broyls, or have been Vehement in the Prosecution of any Lust, as the Ambitious, the Amorous, the Wrathful Man, these still retain the Glimpses and Dreams of such things as they have performed in their Bodies, which makes them either altogether unfit to remain there, where they are, or else keeps them long ere they can put off their Souls. Thus you see *Plutarch's* Opinion concerning the Inhabitants and Neighboursof the Moon, which (according to the manner of the Academicks) he delivers in a Third Person; you see he makes that Planer an Inferior kind of Heaven, and though he differs in many Circumstances, yet doth he describe it to be some such Place, as we suppose Paradise to be. You see likewise his Opinion concerning the Place of the Damned Spirits, that it is in the middle Region of the Air; and in neither of these is he singular, but some more late and Orthodox Writers have agreed with him. As for the place of Hell, many think it may be in the Air, as well as any where else.

*De Civit.
Dei l. 22.
c. 16.*

True indeed, *S. Austin* affirms that this Place cannot be discovered; But others there are who can shew the Situation of it out of Scripture; Some holding it to be in another

another World without this, because our Saviour calls it *κότος ἐξάντην* outward darkness. But the most will have it placed towards the Center of our Earth, because 'tis said, Christ descended into the lower parts of the Earth; and some of these are so Confident, that this is its Situation, that they can describe you its bigness also, and of what Capacity it is. *Francis Ribera* in his Comment on the Revelations, speaking of those words, where 'tis said, *that the Bloud went out of the Wine-press, even unto the Horses-Bridles by the space of one Thousand and Six Hundred Furlongs*, interprets them to be meant of Hell, and that Number expresses the Diameter of its Concavity, which is 200 Italian Miles; But *Lessius* thinks that this Opinion gives them too much Room in Hell, and therefore he guesses that 'tis not so wide; for (saith he) the Diameter of one League being Cubically multiplied; will make a Sphere capable of 800000 Millions of Damned Bodies, allowing to each six Foot in the Square; whereas (says he) 'tis certain, that there shall not be one Hundred Thousand Millions in all that shall be damned. You see the bold Jesuit was careful that every one should have but Room enough in Hell, and by the strangeness of the Conjecture, you may guess that he had rather be absurd, than seem either uncharitable or ignorant. I remember there is a Relation in *Pliny*, how that *Dionysiodorus* a Mathematician, being Dead

*Mat. 25:
30.*

Eph. 4. 9.

Rev. 14. 20

*De Morib.
div. l. 13. c.
24.*

Dead, did send a Letter from this place to some of his Friends upon Earth, to certify them what distance there was betwixt the Center and Superficies: he might have done well to have prevented this Controversie, and enformed them the utmost Capacity of that Place. However, certain it is, that that Number cannot be known; and probable it is, that the place is not yet determined, but that Hell is there where there is any Tormented Soul, which may be in the Regions of the Air, as well as in the Center: And therefore perhaps it is, that the Devil is stiled the Prince of the Air. But of this only occasionally, and by reason of *Plutarch's* Opinion concerning those that are round about the Moon; as for the Moon it self, he esteems it to be a lower kind of Heaven, and therefore in another place he calls it a Terrestrial Star, and an Olympian or Celestial Earth; answerable, (as I conceive) to the Paradise of the School-Men. And, that Paradise was either in, or near the Moon, is the Opinion of some later Writers, who derived it (in all likely-hood) from the Assertion of *Plato*, and perhaps, this of *Plutarch*. *Tostatus* lays this Opinion upon *Isidorus, Hispalensis*, and the Venerable *Bede*; and *Pererius* Fathers it upon *Strabus* and *Rabanus* his Master. Some would have it to be Situated in such a place as could not be discovered, which caused the Pen-Man of *Esdra's* to make it a harder matter to know the outgoings of Paradise,

*Cur silent
cracula.*

*Sir W Raw.
l. 1. c. 3. sect.
7.
In Genes.*

Paradise, than to weigh the weight of the Fire, *2 Esdr. 4. 7.* or Measure the Blasts of Wind, or call again a Day that is past. But notwithstanding this, there be some others, who think, that it is on the Top of some high Mountain under the Line; and these interpreted the Torrid Zone to be the Flaming Sword whereby Paradise was guarded. 'Tis the consent of divers others, that Paradise is Situated in some high and Eminent Place. So *Tostatus*: *Est etiam Paradisus situ altissima, supra omnem terræ altitudinem*, "Paradise is Situated in some high place above the Earth: and therefore in his Comment upon the 49 of *Genesis*, he understands the Blessing of *Jacob*, concerning the everlasting Hills to be meant of Paradise, and the Blessing it self to be nothing else but a Promise of Christs coming, by whose Passion the Gates of Paradise should be opened. Unto him assented *Rupertus, Scotus*, and most of the other School-Men, as I find them Cited by *Pererius*, and out of him in *Sir Walter Rawleigh*. Their reason was this: because in probability, this place was not overflowed by the Flood, since there were no Sinners there, which might draw that Curse upon it. Nay, *Tostatus* thinks, that the Body of *Enoch* was kept there; and some of the Fathers, as *Tertullian* and *Austin*, have affirmed, that the Blessed Souls were reserved in that place till the Day of Judgment; and therefore 'tis likely that it was not overflowed by the Flood, it were easie to

*Comment.
in 2. Gen.
v. 8.
L. 1. c. 3.
sect. 6. 7.*

2Cor. 12. 4.
 Luke 23.
 43.

to produce the Unanimous consent of the Fathers, to prove that Paradise is yet really Existent. Any diligent peruser of them, may easily observe how they do generally Interpret the Paradise whereto Saint Paul was wrapt, and that wherein our Saviour promised the Thief should be with him, to be locally the same from whence our first Parents were Banished. Now there cannot be any Place on Earth designed where this should be: And therefore it is not altogether improbable that it was in this other World.

And besides, since all Men should have went Naked if *Adam* had not Fell, 'tis Requested therefore that it should be Situated in some such place where it might be Priviledged from the Extremities of Heat and Cold. But now this could not be (they thought) so Conveniently in any Lower, as it might in some higher Air. For these and such like Considerations, have so many Affirmed, that Paradise was in a high Elevated place. Which some have Conceived could be nowhere but in the Moon: For it could not be in the Top of any Mountain; nor can we think of any other Body Separated from this Earth, which can be a more Convenient place for Habitation than this Planet; therefore they Concluded that it was there.

It could not be on the Top of any Mountain.

Gen. 7. 19. I. Because we have Express Scripture,

ture, that the Higheft of them was Overflowed.

2. Because it must be of a greater Extension, and not some small Patch of Ground, since tis likely all Men should have Lived there, if *Adam* had not Fell. But for a Satisfaction of the Arguments, together with a Farther Discourse of Paradise, I shall Refer you to those who have Written Purposely upon this Subject. Being content for my own part to have spoken so much of it, as may Conduce to shew the Opinion of others Concerning the Inhabitants of the Moon; I dare not my self Affirm any thing of these *Selenites*, because I know not any Ground whereon to Build any Probable Opinion. But I think that Future Ages will Discover more; and our Posterity, Perhaps, may Invent some means for our better Acquaintance with these Inhabitants.

PROP.

PROP. XIV.

That 'tis Possible for some of our Posterity, to find out a Conveyance to this other World, and if there be Inhabitants there, to have Commerce with them.

ALL that hath been said, Concerning the People of the New World, is but Conjectural, and full of Uncertainties; nor can we ever look for any Evident or more Probable Discoveries in this kind, unless there be some hopes of Inventing means for our Conveyance thither. The Possibility of which, shall be the Subject of our Enquiry in this last Proposition.

And, if we do but Consider by what Steps and Leasure, all Arts do usually rise to their Growth, we shall have no cause to Doubt why this also may not here-

hereafter be found out amongst other Secrets. It hath Constantly yet been the Method of Providence, not presently to shew us all, but to Lead us on by Degrees, from the Knowledge of one thing to another.

'Twas a great While, ere the Planets were Distinguished from the fixed Stars, and some time after that, ere the Morning and Evening Star were Found to be the same. And in greater space (I doubt not) but this also, and other as Excellent Mysteries will be Discoveted. Time, who hath always been the Father of new Truths, and hath Reveiled unto us many things, which our Ancestors were Ignorant of, will also Manifest to our Posterity, that which we now desire, but cannot know. *Veniet tempus (saith Seneca) quo ista quæ nunc latent, in lucem dies extrahet, Nat. Qu. & longioris ævi diligentia.* Time will come, when the Indeavours of after Ages, shall bring such things to Light as now lie hid in Obscurity. Arts are not yet come to their Solitice. But the Industry of Future Times, Assisted with the Labours of their Fore-Fathers, may reach that Height which we could not Attain to. *Veniet tempus quo posterit nostrri nos tam aperta nescisse mirentur.* As we now wonder at the Blindness of our Ancestors, who were not able to Discern such things, as seem Plain and Obvious unto us, so will our Posterity,

M

sterity, Admire our Ignorance in as Perspicuous matters.

In the first Ages of the World the Islanders thought themselves either to be the only Dwellers upon Earth, or else if there were any other, they could not possible Conceive how they might have any Commerce with them, being Severed by the Deep and Broad Sea. But after times Found out the Invention of Ships, in which notwithstanding, none but some bold, Daring Men Durst Venture, according to that of the Tragoedian.

Proser.

And yet now, how easie a thing is this even to a Timorous and Cowardly Nature? And Questionless, the Invention of some other means for our Conveyance to the Moon, cannot seem more Incredible to us, than this did at first to them, and therefore we have no just Reason to be Discouraged in our Hopes of the like Success.

Yea, but (you will say) there can be no Sayling thither, unless that were True which the Poets do but Fain, that she made her Bed in the Sea. We have not now any *Drake*, or *Columbus*, to Undertake this Voyag, or any *Dædalus* to Invent a Conveyance through the Air.

I Answer,

I Answer, Though we have not, yet why may not Succeeding times, Raise up some Spirits as Eminent for new Attempts and Strange Inventions, as any that were before them? 'Tis the Opinion of *Keplar*, that as soon as the art of Flying is Found out, some of their Nation will make one of the first Colonies, that shall Transplant into that other World. I Suppose, his Appropriating this Preheminence to his own Cuntry-Men, may arise from an Overpartial Affection to them. But yet thus far I Agree with him, That when ever that Art is Invented, or any other, whereby a Man may be Conveyed some Twenty Miles high, or thereabouts, then, 'tis not altogether Improbable that some or other may be Successful in this Attempt.

For the better Clearing of which, I shall first lay Down, and then Answer those Doubts that may make it seem utterly Impossible.

These are Chiefly Three.

The First, taken from the Natural Heaviness of a Mans Body, whereby it is made Unfit for the Motion of Ascent, together with the Vast Distance of that Place from us.

2. From the Extreame Coldness of the Æthereal Air.

3. The Extreame Thinness of it.

Both which must needs make it Impassible,

M 2

fible,

fible, though it were but as many Single Miles thither, as it is Thousands.

For the First, Though it were Supposed that a Man could Fly, yet we may well think he would be very Slow in it; since he hath so Heavy a Body, and such a one too, as Nature did not Principally Intend, for that kind of Motion. 'Tis usually Observed, that amongst the Variety of Birds, those which do most Converse upon the Earth, and are Swiftest in their Running, as a Pheasant, Partridge, &c. together with all Domestical Fowl, are less able for Flight, than others, which are for the most part upon the Wing, as a Swallow, Swift, &c. And therefore we may well think, that Man being not Naturally Endowed with any such Condition as may Inable him for this Motion, and being Necessarily tied to a more Especial Residence on the Earth, must needs be Slower than any Fowl, and less Able to hold out. Thus is it also in Swimming; which Art, though it be Grown to a good Eminence, yet he that is best Skilled in it, is not Able, either for Continuance, or Swiftness, to equal a Fish; Because he is not Naturally Appointed to it. So that though a Man could Fly, yet he would be so Slow in it, and so Quickly Weary, that he could never think to Reach so great a Journey as it is to the Moon.

But Suppose with all, that he could Fly

AS

as Fast, and Long, as the Swiftest Bird: yet it cannot Possibly be Conceived, how he should ever be Able to pass through so vast a Distance, as there is betwixt the Moon and our Earth. For this Planner, according to the common Grounds, is usually Granted to be at the Least, 52 Semidiameters of the Earth from us. Reckoning for each Semidiameter 3456 English Miles, of which the whole space will be about 179712.

So that though a Man could Constantly keep on in his Journey thither by a Strait Line, though he could Fly a Thousand Miles in a Day; yet he would not Arrive thither under 180 Days, or Half a Year.

And how were it Possible for any to Tarry so long without Dyet or Sleep?

1. For Diet. I Suppose there could be no Trusting to that Fancy of *Philo* the *Prop: 3.* *Few* (mentioned before) who thinks, that the Musick of the Sphears should Supply the Strength of Food.

Nor can we well Conceive, how a Man should be Able to Carry so much Luggage with him, as might serve for his *Viatum* in so Tedious a Journey.

2. But if he could: yet he must have some time to Rest and Sleep in. And I beleive he shall Scarce find any Lodgings by the Way. No Inns to Entertain Passengers, nor any Castles in the Air (unless they be Enchanted ones) to Receive

M 3

Poor

179712
3456

179712

Poor Pilgrims or Errant Knights. And so Consequently, he cannot have any Possible hopes of Reaching thither.

Notwithstanding all which Doubts, I shall lay down this Position.

That Supposing a Man could Fly, or by any other means, raise himself Twenty Miles upwards, or thereabouts, it were Possible for him to come unto the Moon.

As for those Arguments of the first kind, that seem to overthrow the Truth of this, they Proceed upon a wrong Ground. Whilst they Suppose, that a Condensed Body, in any place of the Air, would always Retain in it a strong Inclination of Tending Down-wards, towards the Center of this Earth. Whereas 'tis more Probable, that if it were but somewhat above this Orb of Vaporous Air, it might there rest Immoveable, and would not have in it any Propension to this Motion of Descent.

*De celo
lib. 4. cap. 1.*

For the better Illustration of this, you must know, that the Heaviness of a Body or (as Aristotle defines it) the proneness of it to tend down unto some Center, is not any absolute quality Intrinsicall unto it, as if, where-ever the Body did retain its Essence, it must also retain this quality: or as if Nature had implanted in every condensed Body *Appetitionem centri, & fugam extremitatis*. Such a Love to the Center and Hatred to the Extremities. Because one of these being less than a quantity, and the

the other no more, cannot have any Power of Attraction or Depulsion in them. According to that Common Principle *Quantitatis nulla est efficacia*.

But now the True Nature of Gravity is this. 'Tis such a respective mutual desire of Union, whereby condensed Bodies, when they come within the Sphere of their own Vigour, do Naturally apply themselves, one to another by Attraction or Coition. But being both without the reach of eithers Vertue, they then cease to move, and though they have general Aptitude, yet they have not any present Inclination or proneness to one another. And so consequently, cannot be styled heavy.

66.
Coper. l. 1.
cap. 26.
Foscarin in
epist. ad
Sebast.
Fantomum;

The meaning of this will be more clearly Illustrated by a Similitude. As any Light Body (suppose the Sun) does send forth his Beams in an Orbicular form; So likewise any Magnetical Body, for Instance, a round Load-stone does cast Abroad his Magnetical Vigour in a Sphere. Thus.

Gilbert. de
Magnete.
l. 2. cap. 7.

M 4

Where

Where suppose the inward Circle at A, to represent the Load-stone, and the outward one betwixt B C, the Orb that does terminate its Vertue.

Now any other Body that is like affected coming within this Sphere, as B, will presently descend towards the Center of it, and in that respect may be stiled heavy. But Place it without this Sphear as C, and then the desire of Union ceaseth, and so consequently the Motion also.

To apply then what hath been said. This great Globe of Earth and Water, hath been proved by many Observations, to participate

pate of Magnetical properties. And as the Load-stone does cast forth its own Vigour round about its Body, in a Magnetical compass: So likewise does our Earth. The difference is, that it is another kind of Affection which causes the Union betwixt the Iron and Load-stone, from that which makes Bodies move unto the Earth. The former is some kind of nearness and Similitude in their Natures, for which Philosophy as yet has not found a particular Name. The latter does arise from that peculiar quality, whereby the Earth is properly distinguished from the other Elements, which is its Condensity. Of which the more any thing does participate, by so much the stronger will be the desire of Union to it. So Gold and others Metals, which are most close in their Composition, are likewise most swift in their Motion of descent.

And though this may seem to be contradicted by the instance of Metalls, which are of the same weight, when they are melted, and when they are hard: As also of Water, which does not differ in respect of Gravity, when it is frozen, and when it is Fluid: yet we must know, that Metalls are not rarified by Melting, but mollified, And so too, for frozen Waters; they are not properly condensed, but congealed into a harder Substance, the parts being not contracted closer together, but still possessing the same Extention. But yet (I say) 'tis very probable, that there is
such

such a Sphere about the Earth, which does terminate its Power of Attracting other things unto it. So that suppose a Body to be placed within the Limits of this Sphere, and then it must needs tend downwards, towards the Center of it. But on the contrary, if it be beyond this compass, then there can be no such Mutual Attraction; and so consequently, it must rest Immoveable from any such Motion.

For the farther Confirmation of this, I shall propose two Pertinent Observations.

The first taken in the presence of many Physicians, and related by an Eminent Man in that Profession, *Hieron. Fracastorius*. There being divers Needles provided of several kinds, like those in a Mariners Chart, they found, that there was an Attractive Power, not only in the magnet; But that Iron also and Steel, and Silver did each of them draw its own Mettle. Whence he concludes, *Omne trahit quod sibi simili est*. And as these peculiar likenesses, have such a Mutual Efficacy; so 'tis porbable, that this more general qualification of condensity, may be the cause, why things so affected desire Union to the Earth. And though 'tis likely that this would appear betwixt two lesser condensed Bodies, (as suppose two peices of Earth) if they were both placed at Liberty in the Æthereal Air, yet being near the Earth, the stronger species

Lib. de Sympath. & Antip. cap. 7.

Vid. Bapr. Misul. exper. Acad. de attract. exper. 4.

cies of this great Globe does as it were drown the less.

'Tis a Common Experiment, that such a Lump of Ore or Stone, as being on the Ground, cannot be moved by less than six Men, being in the bottom of a deep Mine, may be stirred by two. The reason is, because then 'tis compassed with Attractive Beams, there being many above it, as well as below it. Whence we may probably Infer (saith the Learned *Virulam*) "that the Nature of Gravity, does "work but weakly, also far from the Earth; "Because the Appetite of Union in Dense "Bodies, must be more dull in respect of "distance, As we may also conclude from the Motion of Birds, which rise from the ground but heavily, though with much Labour; Whereas being on high, they can keep themselves up, and Soar about by the meer extension of their Wings. Now the Reason of this difference, is not (as some falsely conceive) the depth of Air under them. For a Bird is not heavier when there is but a Foot of Air under him, than when there is a Furlong. As appears by a Sip in the Water, (an instance of the same Nature) which does not sink deeper, and so consequently is not heavier, when it has but Five Fathom depth, than when it has Fifty. But the true reason is, the weakness of the desire of Union in Dense Bodies at a distance,

Nat Hist. Cent. 1. exper. 33.

So that from hence, there might be just

oc-

occasion to Tax *Aristotle* and his followers, for Teaching, that heaviness is an absolute quality of it self, and really distinct from condensity : whereas it is only a Modification of it, or rather, another Name given to a Condensed Body, in reference to its Motion.

For if it were absolute, then it should always be Inherent in its Subject, and not have its Essence depend upon the Bodies being here or there. But it is not so. For,

1. Nothing is heavy in its proper place, according to his own Principle, *Nihil grave est in suo loco*. And then,

2. Nothing is heavy, which is so far distant from that proper Orb to which it does belong, that it is not within the reach of its Vertue. As was before confirmed.

But unto this it may be Objected. Though a Body being so placed, be not heavy *in actu secundo* ; yet it is *in actu primo* : because it retains in it an inward proneness to move downwards, being once severed from its proper Place. And this were reason enough, why the quality of heaviness should have an absolute being.

I Answer, This distinction is only applicable to such Natural Powers as can suspend their Acts ; and will not hold in Elementary qualities, whose very Essence does necessarily require an exercise of the second Act, as you may easily discern by an Induction of all the rest. I cannot say, that Body has in it the quality of Heat, Coldness, Dri-

ness,

ness, Moisture, Hardness, Softness, &c. Which for the present, has not the second Act of these qualities. And if you mean by the Essence of them, a Power unto them : why, there is not any Natural Body but has a Power to them all.

From that which hath been said concerning the Nature of Gravity, it will follow ; That if a Man were above the Sphere of this Magnetical Vertue, which proceeds from the Earth, he might there stand as firmly as in the open Air, as he can now upon the ground : And not only so, but he may also move with a far greater swiftness, than any living Creatures here below, because then he is without all Gravity, being not attracted any way, and so consequently will not be liable to such Impediments, as may in the least manner resist that kind of Motion which he shall apply himself unto.

If you yet enquire, how we may conceive it possible, that a Condensed Body should not be heavy in such a place.

I Answer, By the same reason, as a Body is not heavy in its proper Place. Of this I will set down Two Instances.

1. When a Man is in the Bottom of a deep River, though he have over him a Multitude of heavy Waters, yet he is not burdened with the weight of them. And though another Body, that should be but of an equal Gravity, with these Waters,

when

when they are taken out, would be heavy enough to press him to Death; yet notwithstanding whilst they are in the Channel, they do not in the least manner, Crush him with their Load. The reason is, because they are both in their right places; and 'tis proper for the Man being the more Condensed Body, to be lower than the Waters. Or rather thus, Because the Body of the Man, does more nearly agree with the Earth, in this Affection, which is the ground of its Attraction, and, therefore doth that more strongly attract it, than the Waters that are over it. Now, as in such a case, a Body may lose the Operation of its Gravity, which is, to move, or to press downwards: So may it likewise, when it is so far out of its place, that this Attractive Power cannot reach unto it.

* *Physl.* 1.3. Tis a Pretty Notion to this Purpose, *Q.6. art. 2.* Mentioned by * *Albertus de Saxonia*, and out of him by * *Francis Mendoca*; That the Air is in some part of it Navigable. *l. 4. Prob.* 47. And that upon this Statick Principle; any

Vide Arch.
l. de insi-
dentibus.
humido.

Brass or Iron Vessel (Suppose a Kettle) whose Substance is much Heavier than that of the Water, yet being Filled with the Lighter Air, it will Swim upon it, and not Sink. So Suppose a Cup, or Wooden Vessel, upon the outward Borders of this Elementary Air, the Cavity of it being filled with Fire, or rather Æthereal Air, it must Necessarily upon the same Ground Remain Swimming there, and of it self can

can no more Fall, than an Empty Ship can Sink.

'Tis commonly granted, that if there were a Hole quite through the Center of the Earth, though any Heavy Body (as Suppose a Millstone) were let Fall into it, yet when it came unto the place of the Center, it would there rest Immoveable in the Air. Now, as in this Case, its own Condensity, cannot hinder, but that it may Rest in the Open Air, when there is no other Place, to which it should be Attracted: So neither could it be any Impediment unto it, if it were placed without the Sphere of the Earths Magnetical Vigor, where there should be no Attraction at all.

From hence then (Ifay) you may Conceive, that if a Man were beyond this Sphere, he might there stand as firmly in the Open Air, as now upon the Earth. And if he might Stand there, why might he not also Go there? And if so; then there is a Possibility likewise of having other Conveniences for Travelling.

And here 'tis Considerable, that since our Bodys will then be Devoid of Gravity, and other Impediments of Motion; we shall not at all Spend our selves in any Labour, and so Consequently not much need the Reparation of Diet: But may perhaps Live altogether without it, as those Creatures have done; who by Reason of their Sleeping for many Days together

gether, have not spent any Spirits, and so not wanted any Food: which is commonly related of Serpents, Crocodiles, Bears, Coockoes, Swallows, and such like. To this Purpose, * *Mendoca* reckons up divers strang Relations. As that of *Epi-mendies*, who is Storied to have Slept 75 Years. And another of a Rustick, in *Germany*, who being Accedentially covered with a Hay-Rick, Slept there for all Autumn, and the Winther following, without any Nourishment.

Or, if this will not serve; yet why may not a Papist fast so long, as well as *Ignatius* or *Xaverius*? Or if there be such a strange Efficacy in the Bread of the Eucharist, as their Miraculous Relations do Attribute to it: why then, that may serve well enough, for their *Vaticum*.

Or, if we must needs Feed upon something else, why may not Smells Nourish us? * *Plutarch*, and * *Pliny* and Divers other Ancients, tell us of a Nation in *India* that lived only upon Pleasing Odors. And 'tis the Common Opinion of Physitians, that these do strangely both Strengthen and Repair the Spirits. Hence was it that *Democritus* was Able for divers Days together to Feed himself with the meer Smel of Hot Bread.

Or if it be Necessary that our Stomacks must Receive the Food: why then, 'tis not Impossible, that the Purity of the Æthereal

**Viridar.*

real Air, being not mixed with any Improper Vapours, may be so Agreeable to our Bodys, as to yeeld us sufficient Nourishment; According to that of the Poet;

-----*Vescitur aura*

Virgil.

Æthere?-----

'Twas an Old *Platonick* Principle, that there is in some part of the World such a place where Men might be Plentifully Nourished, by the Air they Breath: Which cannot more Properly be Assigned to any one Particular, than to the Æthereal Air above this.

I know 'tis the common Opinion, that no Element can prove Aliment, because 'tis not Proportionate to the Bodys of living Creatures which are Compounded. But,

1. This Æthereal Air is not an Element; and though it be purer, yet 'tis perhaps of a greater Agreeableness to Mans Nature and Constitution.

2. If we consult Experience and the credible Relations of others, we shall find it Probable enough that many things Receive Nourishment from meer Elements.

First, for the Earth; * *Aristotle* and The Earth * *Pliny*, those two great Naturalists, tell us of some Creatures, that are Fed only with this. And it was the Curse of the Serpent, Gen. 3. 14. Upon thy Belly shalt thou go, and Dust shalt thou Eat all the Days of thy Life.

The
Water
*De Anim.
lib. 7.
*De Pifc.
l. 1. cap. 12.

So likewise for the Water. * *Albertus Magnus* speaks of a Man who Lived seven Weeks together by the meer Drinking of Water. * *Rondoleius* (to whose Diligence these later Times are much be- holding for sundry Observations concern- ing the Nature of Aquatils) Affirms, that his Wife did keep a Fish in a Glafs of Water; without any other Food, for Three Years; In which space it was Constantly Augmented, till at first it could not come out of the place at which it was put in, and at length was too Big for the Glafs it selfe, though that were of a large Capacity. *Cardan* tells us of some Worms, that are Bred and Nourished by the Snow, from which being once Separated, they Dye.

Subtil. l. 9.

The Air

Thus also is it with the Air, which we may well Conceive does Chiefly Concur to the Nourishing of all Vegetables. For if their Food were all Sucked out from the Earth, there must needs be then, some sensible decay in the Ground by them; Especially, since they do every Year re- new their Leaves, and Fruits: which be- ing so many, and so often, could not be Produced without Abundance of Nourishment. To this Purpose is the Experi- ment of Trees cut down, which will of themselves put fourth Sprouts. As also that of *Onions*, and the *Semper-vive*, which will strangely shoot Forth, and Grow as they hang in the open Air. Thus likewise is it with some Sensible Creatures; the

the *Camelion* (saith * *Pliny* and * *Solinus*) * *Hist. l. 8* is meerly Nourished by this: And so are the Birds of Paradise, Treated of by * *Polyhistor. cap. 33.* many; which reside Constantly in the Air, * *Lop. hist. cap. 53.* Nature having not bestowed upon them any Legs, and therefore they are never seen upon the Ground, but being Dead. * *Majolus Collog. 3.* If you ask, how they Multiply? 'Tis Answered, they lay their Eggs on the Backs of one another, upon which they sit till their Young Ones be Fledg'd. * *Rondoleius* from the History of *Hermolaus Barbarus*, tells us of a Priest (of whom one of the Popes had the Custody) that Lived Forty Years upon meer Air. As also of a Maid in *France*, and another in *Germany*, that for divers Years together did Feed on nothing but this: Nay, he Affirms, that he himself had seen one, who Lived till Ten Years of Age, without any other Nourishment. You may find most of these, and some other Examples to this purpose, gathered together by *Mendoca Viridar. lib. 4. Prob. 23, 24.* Now, if this Elementary Air which is mixed with such Improper Vapors, may Accidentally Nourish some Persons; Perhaps then, that pure Æthereal Air may of it self be more Natural to our Tempers.

But if none of these Conjectures may Satisfie; yet there may Happily be some Possible means for the Conveiance of other Food, as shall be shewed afterwards.

Again, seeing we do not then Spend our selves in any Labour, we shall not, it may be, need the Refreshment of Sleep. But if we do, we cannot desire a Softer Bed than the Air, where we may Repose our selves Firmly and Safely as in our Chambers.

But here you may ask, whether there be any means for us to know, how far this Sphere of the Earths Vertue does Extend it self?

I Answer, 'tis Probable that it does not reach much farther than that Orb of thick Vaporous Air, that Incompasseth the Earth; because 'tis likely the Sun may Exhale some Earthly Vapors, near unto the utmost bounds of the Sphere allotted to them.

Now there are divers ways used by Astronomers, to take the altitude of this Vaporous Air. As,

1. By Observing the height of that Air which causeth the *Crepusculum*, or Twilight; For the finding of which, the Antients used this means: As soon as ever they could Discern the Air in the East to be altered with the least Light, they would by the Situation of the Stars find how many Degrees the Sun was below the *Horizon*, which was usually about 18. From whence they would easily Conclude, how high that Air must be above us, which the Sun could shine upon, when he was

18 Degrees

18 Degrees below us. And from this Observation, it was Concluded to be about *Vitel. l. 10*
52 Miles high. *Töes. 7.*

But in this Conclusion, the Antients were much deceived, because they proceeded upon a wrong Ground, whilst they supposed that the shining of the Suns direct Rays upon the Air, was the only reason of *Crepusculum*; Whereas 'tis certain that there are many other things which may also concur to the causing of it. As, *Keplar. Ep. Coper. l. 1. part. 3.*

1. Some bright Clouds below the *Horizon*, which being Illuminated by the Sun, may be the means of conveying some Light to our Air, before the direct Rays can touch it.

2. The often refraction of the Rays, which Suffer a Frequent Repercussion from the Cavity of this Sphere, may likewise yeild us some Light.

3. And so may the Orb of enlightened Air compassing the Sun, part of which must rise before his Body.

2. The second way whereby we may more surely find the Altitude of this grosser Air, is by taking the highest Cloud: which may be done, 1. Either as they use to measure the Altitude of things that cannot be approached unto, *viz.* by two Stations, when two Persons shall at the same time, in several places, observe the Declination of any Cloud from the Vertical point. Or, *Stevinus. Geog. l. 3.* which is the more easie way, when a Man shall choose such a Station, where he may

N 3

at

at some distance; discern the place on which the Cloud does cast its shadow, and withal does Observe, how much both the Cloud and the Sun decline from the Vertical point. From which he may easily conclude the true Altitude of it, as you may more plainly conceive, by this following Diagram.

Where AB is a perpendicular from the Cloud, C the Station of him that Measures, D the place where the shadow of the Cloud does fall.

The Instrument being directed from the Station C , to the Cloud at A , the perpendicular will shew the Angle BAC . Then letting the Sun shine through the Sights of your Instrument, the perpendicular of it will

will give the Angle BAD . Afterwards having measured the distance CD by *pa-Pisic. Tri-*
ces, you may according to the common *gon.*
Rules, find the height BA .

But if without making the Observation, you would know of what Altitude the highest of these are found by Observation;

* *Cardan* answers, not above Two Miles; * *Subr.l.*

Keplar, not above 1600 Paces, or thereabouts. 17.

3. Another way to find the height of this Vaporous Air, is, by knowing the difference of Altitude, which it causeth, in refracting the Beams of any Star near the *Horizon*. And from this Observation also, it is usually concluded to be about Two or Three Miles high. ** Epit. Co-per.l. 1. p. 3.*

But now you must not conceive, as if the Orb of Magnetical Vigor, were bounded in an exact Superficies, or, as if it did equally hold out just to such a determinate Line, and no farther. But as it hath been said of the first Region, which is there terminated, where the Heat of Reflection does begin to Languish: So likewise is it probable, that this Magnetical Vigor does Remit of its degrees proportionally to its distance from the Earth, which is the cause of it: And therefore though the thicker Clouds may be Elevated no higher, yet this Orb may be continued in weaker degrees a little beyond them. We will suppose it (which in all likely-hood is the most) to be about Twenty Miles high. So that you see the former Thesis remains probable:

that if a Man could but Fly, or by any other means get Twenty Miles upwards, it were possible for him to reach unto the Moon.

But it may be again Objected: Though all this were true; though there were such an Orb of Air which did terminate the Earths Vigour: And though the heavyness of our Bodies could not hinder our passage, through the vast spaces of the Ætherial Air; yet those two other Impediments may seem to deny the possibility of any such Voyage.

1. The extream coldness of that Air. If some of our higher Mountains for this reason be not habitable; much more then will those places be so, which are farther from any cause of Heat.

2. The extream thinness of it, which may make it unfit for Expiration. For if in some Mountains (as *Aristotle* tells us of *Olympus*, and our him * *S. Austin*) the Air be so thin that Men cannot draw their Breath, unless it were through some moistened Spunges; much more then must that Air be thin, which is more remotely Situated from the causes of Impurity and Mixture. And then beside, the Refraction that is made by the Vaporous Air incompassing our Earth, may sufficiently prove that there is a great difference betwixt the Ætherial Air and this, in respect of Rarity.

To the first of these I answer, that though the

* In Gen.
ad literam.
li. 3. cap. 2.

the second Region, be naturally endowed with so much Coldness as may make it fit for the Production of Meteors; yet it will not hence follow, that all that Air above it, which is not appointed for the like purpose, should partake of the same Condition: But, it may seem more probable that this Æthereal Air, is freed from having any quality in the extrems. And this may be confirmed, from those Common Arguments, which are usually brought to prove the warmth of the Third Region. As you may see in * *Fromundus*, and others who Treat of that Subject.

* Meteor.
lib. 1. c. 2.
art. 1.

'Tis the Assertion of *Pererius*, that the second Region, is not cold meerly for this reason, because it is distant from the Ordinary causes of Heat, but because it was actually made so at the first, for the Condensing of the Clouds, and the Production of other Meteors that were there to be generated; which (as I conceive) might be sufficiently confirmed from that Order of the Creation Observed by *Moses*, who tell us that the Waters above the Firmament (by which, in the greatest probability, we are to understand the Clouds in the second Region) were made the second day, Gen. 1. 7, 8. Whereas the Sun it self (whose Reflection is the cause of Heat) was not Created till the Fourth Day, ver. 16. 19.

To the other Objection, I Answer, that though the Air in the second Region (where by reason of its coldness there are many thick

Comment.
in Gen. 1. 8.

thick Vapours) do cause a great Refraction; yet 'tis probable that the Air which is next the Earth, is sometimes, and in some places, of a far greater thinness, nay, as thin as the Æthereal Air it self; since sometimes there is such a special Heat of the Sun, as may Rarifie it in an Eminent degree; And in some dry places, there are no gross impure Exhalations to mix with it.

But here it may be Objected. If the Air in the second Region were more Condensed and heavy than this wherein we Breathe, then that must necessarily tend downwards and possess the lower place.

To this some Answer, That the hanging of the Clouds in the open Air, is no less than a Miracle. They are the Words of *Pliny. Quid mirabilius, aquis in celo stantibus?* what more wonderful thing is there than that the Waters should stand in the Heavens? Others prove this from the Derivation of the word *מים* from *שׂוּא* *stufcere* and *מים* *aqua*: Because the Waters do hang there after such a stupendous inconceivable manner; Which seems likewise to be favoured by Scripture, where 'tis mentioned as a great Argument of Gods Omnipotency, that he holds up the Clouds from falling. *He binds up the Waters in his thick Clouds, and the Cloud is not rent under them.*

But that which unto me seems full Satisfaction against this doubt, is this Con-

Consideration; that the Natural Vigor, whereby the Earth does attract Dense Bodies unto it, is less Efficacious at a distance: and therefore a Body of less Density, which is near unto it, as suppose, this thin Air wherein we breathe, may Naturally be lower in its Situation, than another of a greater Condensity that is farther off; as suppose, the Clouds in the second Region. And though the one be absolutely, and in it self more fit for this Motion of Descent; yet, by reason of its distance, the Earths Magnetical Vertue cannot so Powerfully work upon it.

As for that Relation of *Aristotle*; If it were true; yet it does not prove this Air to be altogether impossible, since moistened Sponges might help us against its thinness: But 'tis more likely, that he took it upon Trust, as he did some other Relations concerning the height of the Mountains, wherein 'tis Evident, that he was grossly mistaken. As where he tells us of *Caucasus*, that it cast its shadow 560 Miles. And this Relation being of the same Nature, we cannot safely trust unto him for the Truth of it. Meteor. l. i. c. ii.

If it be here enquired; what means there may be Conjectured, for our ascending beyond the Sphere of the Earths Magnetical Vigor.

I Answer, 1. 'Tis not perhaps impossible, that a Man may be able to Fly, by the Application of Wings to his own Body; As Angels are Pictured, as *Mercury* and *Dædalus*

lus are feigned, and as hath been attempted by divers, particularly by a Turk in Constantinople, as *Busbequius* Relates.

Mr. Burton.
Melanch.
pa. 2. sect. 2.
mem. 3.
* Lib. 3. c.
40.

2. If there be such a great Ruck in Madagascar, as * *Marcus Polus* the Venetian mentions, the Feathers in whose Wings are Twelve Foot Long, which can scoop up a Horse and his Rider, or an Elephant, as our Kites do a Mouse; why then 'tis but Teaching one of these to carry a Man, and he may Ride up thither, as *Ganymed* does upon an Eagle.

3. Or if neither of these Ways will serve: Yet I do seriously, and upon good Grounds, affirm it possible to make a Flying Chariot. In which a Man may sit, and give such a Motion unto it, as shall convey him through the Air. And this perhaps might be made large enough to carry divers Men at the same time, together with Food for their *Viticum*, and Commodities for Traffique. It is not the bigness of any thing in this kind, that can hinder its Motion, if the Motive Faculty be answerable thereunto. We see a great Ship Swims as well as a small Cork, and an Eagle Flies in the Air as well as a little gnat.

This Engine may be contrived from the same Principles by which *Archytas* made a wooden Dove, and *Regiomontanus* a wooden Eagle.

I conceive it were no difficult matter (if a Man had leisure) to shew more particularly; the means of composing it.

The

The perfecting of such an Invention, would be of such excellent use, that it were enough, not only to make a Man Famous, but the Age also wherein he Lives. For besides the strange discoveries that it might occasion in this other World, it would be also of inconceivable advantage for Travelling, above any other Conveiance that is now in use.

So that notwithstanding all these seeming impossibilities, 'tis likely enough, that there may be a means invented of Journying to the Moon; And how happy shall they be, that are first successful in this attempt?

-----*Felicesque animæ, quas nubila supra,
Et turpes fumos, plenumque vaporibus orbem,
Inseruit cælo sancti scintilla Promethei.*

Having thus finished this Discourse, I chanced upon a late fancy to this purpose under the fained Name of *Domisgo Gonsales*, written by a late Reverend and Learned Bishop: In which (besides Sundry particulars wherein this later Chapter did unwittingly agree with it) there is delivered a pleasant and well contrived Fancy concerning a Voyage to this other World.

He Supposeth that there is a Natural and usual Passage for many Creatures betwixt our Earth and this Plannet. Thus he says; those great Multitudes of Locusts wherewith divers Countries have bin Destroyed, do Proceed from thence. And if we Peruse the Authors who Treat of them, we shall find that many times they Fly in

Num.

Numberless Troops, or Swarms, and for sundry Days together before they Fall, are seen over those places in great high Clouds, such as coming nearer, are of Extension enough to Obscure the Day, and hinder the Light of the Sun. From which, together with divers other such Relations, he Concludes, that 'tis not altogether Improbable, they should proceed from the Moon. Thus likewise he Supposeth the Swallows, Cuckoes, Nightingales, with divers other Fowl, which are with us only half a Year, to Fly up thither, when they go from us. Amongst which kind, there is a Wild Swan in the East-Indies, which at certain Seasons of the Year do Constantly take their Flight thither. Now this Bird being of a great Strength, able to Continue for a long Flight, as also going usually in Flocks, like our Wild, Geese; he Supposeth that many of them together, might be thought to carry the Weight of a Man; especially, if an Engine were so Contrived (as he thinks it might) that each of them should Bear an equal share in the Burden. So that by this means, 'tis easily Conceivable, how once every Year a Man might Finish such a Voyage; going along with these Birds at the beginning of Winter, and again Returning with them at the Spring.

And here, One that had a strong Fancy, were better Able to set forth the great Benefit and Pleasure to be had by such a Journey

Journey. And that whether you Consider the Strangeness of the Persons, Language, Art, Policy, Religion of those Inhabitants, together with the new Traffick that might be brought thence. In Brief, do but Consider the Pleasure and Profit, of those later Discoveries in *America*, and we must needs Conclude this to be Inconceivably beyond it.

But such Imaginations as these, I shall leave to the Fancy of the Reader.

-----*Sic itur ad astra.*

Reptet humi quicunque velit-----

Cælo restat iter, cælo tentabimus ire:

FINIS.

A
DISCOURSE

Concerning a

New Planet,

Tending to prove

That 'tis probable our EARTH
is one of the PLANETS.

The Second Book.

By John Wilkins, late L. Bishop of Chester.

Digna res est Contemplatione, ut sciamus in quo rerum statum scimus: pigrissimam sortiti, an velocissimam sedem: circa nos Deus omnia, an nos agat. Sen. Nat. Quest. lib. 7. cap. 2.

L O N D O N:

Printed by J. D. for John Gellibrand, at
the Golden Ball in St. Paul's Church-
Yard. M.DC.LXXXIV.

To the Reader.

NOt to trouble you with an *Invective* against those multitudes of *Pamphlets* which are every day prest into the World; or an *Apologie*, why this was published amongst the rest (the usual Matter for such kind of Epistles): Let me in brief preadmonish you something concerning the chief Scope and Manner of this following Discourse.

1. 'Tis not the *purpose* of it, to set down an exact Treatise of this kind of *Astronomy*; but rather to remove those common Prejudices, which usually deter Men from taking any *Argument* tending this way, into their considerations. For we may observe, that in those Points which are cried down by the more

To the Reader.

general Opinion, Men do for the most part rest themselves in the superficial knowledg of things, as they seem at their first appearances, thinking they can say enough to any Paradox, against which they can urge the most obvious and easy Objections; and therefore seldom or never search into the depth of these Points, or enter into any serious impartial examination of those grounds on which they are bottom'd. Which as it must needs be a great hindrance to the proficiency of all kind of Learning; so more especially is it in this particular. We might discern a greater comeliness and order in this great Fabrick of the World, and more easily understand the Appearances in Astronomy, if we could with indifferency attend to what might be said for that Opinion of *Copernicus*, which is here defended.

2. For

To the Reader.

2. For the Manner. It is not maintained with such Heat and Religion, as if every one that reads it, were presently bound to yield up his assent: But as it is in other Wars, where *Victory* cannot be had, Men must be content with Peace: So likewise is it in this, and should be in all other Philosophical Contentions. If there be nothing able to convince and satisfy the indifferent Reader, he may still enjoy his own Opinion. All Men have not the same way of apprehending things; but according to the variety of their Temper, Custom, and Abilities, their Understandings are severally fashioned to different Assents: Which had it been but well considered by some of our hot *Adversaries, they would not have shewed more violence in opposing the Persons against whom they write, than strength in confuting the Cause.

*Fromond.
Al Roſſe.

'Tis

To the Reader.

'Tis an excellent Rule to be observed in all Disputes, That Men should give *soft Words* and *hard Arguments*; that they would not so much strive to *vex*, as to *convince* an Enemy. If this were but diligently practised in all Cases, and on all sides, we might in a good measure be freed from those Vexations in the search of Truth, which the wise Solomon, by his own experience did so much complain of: *Eccles. 1. 18.* *In much Wisdom there is much Grief; and he that increaseth Knowledge, increaseth Sorrow.*

To conclude: Tho there should be nothing in this Discourse conducive to your Information and Benefit; yet it may serve in the *Perusal*, as it did in the *Composure*, for the recreation of such leisure hours, as may conveniently be spared from more weighty Employments. Farewel.

The

The PROPOSITIONS that
are insisted on in this Discourse.

PROP. I.

THat the seeming Novelty and Singularity of this Opinion, can be no sufficient Reason to prove it Erroneous.

PROP. II.

That the places of Scripture, which seem to intimate the Diurnal Motion of the Sun, or Heavens, are fairly capable of another interpretation.

PROP. III.

That the Holy Ghost, in many places of Scripture, does plainly conform his Expressions to the Error of our Conceits, and does not speak of sundry things as they are in themselves, but as they appear unto us.

PROP. IV.

That divers learned Men have fallen into great Absurdities, whilst they have looked for the Grounds of Philosophy from the Words of Scripture.

PROP. V.

That the words of Scripture, in their proper
and

The Table.

and strict construction, do not any where affirm the Immobility of the Earth.

PROP. VI.

That there is not any Argument from the words of Scripture, Principles of Nature, or Observations in Astronomy, which can sufficiently evidence the Earth to be in the Centre of the Universe.

PROP. VII.

'Tis probable that the Sun is in the Centre of the World.

PROP. VIII.

That there is not any sufficient reason to prove the Earth incapable of those Motions which Copernicus ascribes unto it.

PROP. IX.

That it is more probable the Earth does move, than the Heavens.

PROP. X.

That this Hypothesis is exactly agreeable to common Appearances.

That

(1)

That the EARTH May be a PLANET.

PROP. I.

That the seeming Novelty and Singularity of this Opinion, can be no sufficient Reason to prove it Erroneous.

IN the search of Theological Truths, it is the safest method, first of all to look unto Divine Authority ; because that carries with it as clear an evidence to our Faith, as any thing else can be to our Reason. But on the contrary, in the examination of Philosophical points, it were a preposterous course to begin at the Testimony
B and

and Opinion of others, and then afterwards to descend unto the Reasons that may be drawn from the Nature and Essence of the things themselves: Because these inartificial Arguments (as the *Logicians* call them) do not carry with them any clear and convincing evidence; and therefore should come after those that are of more necessary dependence, as serving rather to confirm, than resolve the Judgment.

But yet, so it is, that in those points which are besides the common Opinion, men are carried away at the first by the general cry, and seldom or never come so far as to examine the reasons that may be urged for them. And therefore, since it is the purpose of this discourse to remove those prejudices which may hinder our Judgment in the like case, 'tis requisite that in the first place there be some satisfaction given to those Arguments that may be taken from the Authority of others.

Which Arguments are insisted on by our adversaries with much heat and violence.

What (say they) shall an upstart Novelty thrust out such a Truth as hath passed by successive tradition through all Ages of the World? And hath been generally entertained, not only in the Opinion of the vulgar, but also of the greatest Philosophers and most Learned Men? * Shall we think that amongst the multitude of those who in several times have been eminent for new inventions and strange discoveries, there was none

* *Alex.
Ress. de
Terre
motu, con-
tra Lansb.
lib. I. sect. I.
cap. 10.*

able

able to find out such a Secret as this, besides some fabulous *Pythagorians*, and of late *Copernicus*? Is it possible that the World should last for above five thousand years together, and yet the Inhabitants of it be so dull and stupid, as to be unacquainted with its motion? Nay, shall we think that those excellent Men, whom the Holy Ghost made use of in the penning of Scripture, who were extraordinarily inspired with supernatural Truths, should notwithstanding be so grossly ignorant of so common a matter as this? Can we believe, if there were any such thing, that *Josuah*, and *Job*, and *David*, and *Solomon*, &c. should know nothing of it? Certainly it must needs argue a strong affectation of Singularity, for a Man to take up any groundless fancy against such antient and general Authority.

I answer: As we should not be so fondly conceited of our selves, and the extraordinary Abilities of these present Ages, as to think every thing that is antient to be absolute: Or, as if it must needs be with Opinions, as it is with Clothes, where the newest is for the most part best. So neither should we be so superstitiously devoted to Antiquity, as to take up every thing for Canonical, which drops from the pen of a Father, or was approved by the consent of the Antients. 'Tis an excellent saying; * *Δὲ ἐλευσέειον τῷ γνῶμη ἢ μέλλοις φιλοσοφῆν*. It behoves every one in the search of Truth, always to preserve a Philosophical liberty: Not to be so enslaved

* *Alcinou*

to the Opinion of any Man, as to think what ever he says to be infallible. We must labour to find out what things are in themselves by our own experience, and a through examination of their natures, not what another says of them. And if in such an impartial enquiry, we chance to light upon a new way, and that which is besides the common rode, this is neither our fault, nor our unhappiness.

Not our fault, because it did not arise from Singularity or Affectation. Not our unhappiness, because it is rather a Privilege to be the first in finding out such Truths, as are not discernable to every common eye. If Novelty should always be rejected, neither would Arts have arrived to that perfection wherein now we enjoy them; nor could we ever hope for any future reformation: Though all Truth be in it self Eternal; yet in respect of Mens Opinions, there is scarce any so antient, but had a beginning, and was once accounted a Novelty; and if for this reason it had been condemned as an error, what a general darkness and ignorance would then have been in the World, in comparison of that light which now abounds; according to that of the Poet:

* Horat.
lib. 2. ep. 1.

* *Quod si tam Antiquis Novitas invisa fuisset,
Quam nobis, quid nunc esset vetus aut quid haberet,
Quod legerent teneretq; virum publicus usus?*

If our Forefathers had but hated thus,
All that were new, what had been old to us?
Or,

Or, how might any thing confirmed be,
For publick use, by its Antiquity?

But for more full satisfaction of all those scruples that may arise from the seeming Novelty or Singularity of this Opinion, I shall propose these following considerations.

Suppose it were a Novelty: Yet 'tis in *Confid. 1.* Philosophy, and that is made up of nothing else; but receives addition from every days experiment. True indeed, for Divinity we have an infallible rule that do's plainly inform us of all necessary Truths; and therefore the Primitive Times are of greater Authority, because they were nearer to those holy Men who were the Pen-Men of Scripture. But now for Philosophy, there is no such reason: What ever the School-Men may talk; yet *Aristotles* works are not necessarily true, and he himself hath by sufficient Arguments proved himself to be liable unto error. Now in this case, if we should speak properly, Antiquity do's consist in the old age of the World, not in the youth of it. In such Learning as may be increased by fresh experiments and new discoveries: 'Tis we are the Fathers, and of more Authority than former Ages; because we have the advantage of more time than they had, and Truth (we say) is the Daughter of Time. However, there is nothing in this Opinion so Magisterially proposed, but the Reader may use his own liberty; and if all the reasons considered together,

do not seem convincing unto him, he may freely reject it.

In those natural points which carry with them any doubt or obscurity, it is the safest way to suspend our assents: And though we may dispute *pro* or *con*; yet not to settle our Opinion on either side.

Confid. 2. In weighing the Authority of others 'tis not their multitude that should prevail, or their skill in some things that should make them of credit in every thing, but we should examine what particular insight and experience they had in those times for which they are cited. Now 'tis plain, that Common People judge by their senses; and therefore, their voices are altogether unfit to decide any Philosophical doubt, which cannot well be examined or explained without Discourse and Reason. And as for the antient Fathers, though they were Men very eminent for their holy lives and extraordinary skill in Divinity; yet they were most of them very Ignorant in that part of Learning which concerns this Opinion, as appears by many of their gross mistakes in this kind, as that concerning the *Antipodes*, &c. and therefore it is not their Opinion neither, in this business, that to an indifferent seeker of Truth will be of any strong Authority.

* *Alex. Ross. l. 1. c. 8.* But against this it is * objected, that the instance of the *Antipodes* do's not argue any special Ignorance in these Learned Men: Or, that they had less skill in such human Arts than

than others; since *Aristotle* himself, and *Pliny*, did deny this as well as they.

I answer:

1. If they did, yet this do's make more to the present purpose: For if such great Schollars, who were so eminent for their knowledge in natural things, might yet notwithstanding be grossly mistaken in such matters as are now evident and certain: Why then we have no reason to depend upon their assertions or Authorities, as if they were infallible.

2. Though these great Naturalists, for want of some experience were mistaken in that Opinion, whilst they thought no place was habitable but the temperate *Zones*; yet it cannot be from hence inferred, that they denied the possibility of *Antipodes*: Since these are such Inhabitants as live opposite unto us in the other temperate *Zone*; and 'twere an absurd thing to imagin that those who lived in different *Zones*, can be *Antipodes* to one another; and argues that a Man did not understand, or else had forgotten that common distinction in *Geography*, wherein the relation of the Worlds Inhabitants unto one another, are reckoned up under these three heads; *Antæci*, *Periæci*, and *Antipodes*. But to let this pass: 'Tis certain, that some of the Fathers did deny the being of any such, upon other more absurd grounds. Now if such as *Chrysostom*, *Lactantius*, &c. who were noted for great Schollars, and such too as flourished in these latter times, when all human Learning was

more generally profest, should notwithstanding be so much mistaken in so obvious a matter: Why then may we not think that those Primitive Saints, who were the Pen-Men of Scripture, and eminent above others in their time for Holiness and Knowledge, might yet be utterly Ignorant of many Philosophical Truths, which are commonly known in these days? 'Tis probable, that the Holy Ghost did inform them only with the knowledge of those things whereof they were to be the Pen-Men, and that they were not better skilled in points of Philosophy than others. There were indeed some of them who were supernaturally indowed with human Learning; yet this was, because they might thereby be fitted for some particular ends, which all the rest were not appointed unto: Thus *Solomon* was strangely gifted with all kind of knowledge, in a great measure, because he was to teach us by his own experience the extreme Vanity of it, that we might not so settle our desires upon it, as if it were able to yield us contentment. So too the Apostles were extraordinarily inspired with the knowledge of Languages, because they were to preach unto all Nations. But it will not hence follow, that therefore the other Holy Pen-Men were greater Schollars than others. 'Tis likely that *Job* had as much human Learning as most of them, because his Book is more especially remarkable for lofty expressions, and discourses of Nature; and yet 'tis not likely that he was acquainted with

Ecc. 1. 18.

with all those mysteries which later Ages have discovered; because when God would convince him of his own Folly and Ignorance, he proposes to him such questions, as to him were altogether unanswerable; which notwithstanding, any ordinary Philosopher in these days might have resolved: As you may see at large in the thirty eighth Chapter of that Book.

The occasion was this: *Job* having * be- *Cap. 13. 3. fore desired that he might dispute with the Almighty concerning the uprightness of his own ways, and the unreasonableness of those afflictions which he underwent, do's at length obtain his desire in this kind; and God vouchsafes in this thirty eighth Chapter, to argue the case with him. Where he do's shew *Job* how unfit he was to judge of the ways of Providence, in disposing of Blessings and Afflictions, when as he was so Ignorant in ordinary matters, being not able to discern the reason of natural and common events. As † why the Sea should be so bound † V. 8. 10, ded from overflowing the Land? What is † 11. the * breadth of the Earth? What is the † reason of the Snow or Hail? What was the † Ver. 18. * cause of the Rain or Dew, of Ice and Frost, * Ver. 22. † V. 28. 29. and the like. By which questions, it seems *Job* was so utterly puzzled, that he is fain afterwards to humble himself in this acknowledgment: * I have uttered that I understood * C. 42. 3 not, things too wonderful for me, which I knew not: Wherefore I abhor my self, and repent in dust and ashes.

So

So that 'tis likely these Holy Men had not these human Arts by any special inspiration, but by instruction and study, and other ordinary means; and therefore *Moses* his skill in this kind is called the Learning of the E-

gyptians. Now because in those times all Sciences were taught only in a rude and imperfect manner; therefore 'tis likely that they also had but a dark and confuse apprehension of things, and were liable to the common errors. And for this reason is it, why *

* *Josh ca.* *Tostatus* (speaking of *Joshuas* bidding the Moon stand still as well as the Sun) says
10. *Quest.* *Quod forte erat imperitus circa Astrorum doctrinam, sentiens ut vulgares sentiunt:* That perhaps he was unskilful in Astronomy, having the same gross conceit of the Heavens, as the vulgar had. From all which it may be inferred, that the Ignorance of such good Men and great Schollars concerning these Philosophical points, can be no sufficient reason, why after examination we should deny them, or doubt of their Truth.

Confid. 3. 'Tis considerable, that in the rudiments and first beginnings of *Astronomy*, and so in several Ages after, this Opinion hath found many Patrons, and those too Men of eminent note and Learning. Such was more especially *Pythagoras*, who was generally and highly esteemed for his divine wit, and rare inventions; under whose mysterious sayings, there be many excellent Truths to be discovered.

But against his Testimony, it is again
† objected;

† objected; If *Pythagoras* were of this Opinion, yet his Authority should not be of any credit, because he was the Author of many other monstrous absurdities. *Alex. Ross. l. 2. § 6. 2. c. 10.*

To this I answer: If a Mans error in some particulars should take away his credit for every thing else, this would abolish the force of all human Authority; for *humanum est errare*. Secondly, 'tis probable that many of *Pythagoras*'s sayings which seem so absurd, are not to be understood according to their letter, but in a mystical sense.

2. But he objects again, that *Pythagoras* was not of this Opinion; and that for two reasons: First, because no Antient Author that he had read ascribes it unto him. Secondly, it is contradictory to his other Opinions, concerning the Harmony that was made by the motion of the Heavens; which could not consist with this other of the Earth's motion.

To the First I answer: The Objector could not chuse but know that this assertion is by many Antient Authors ascribed to that sect, whereof *Pythagoras* was the chief. He might have seen it expressly in * *Aristotle* himself: * *De Caelo*.
Οἱ ὃ Πυθαγόρειοι λέγουσιν ὅτι μὴ τὸ μέγεθος τῆς γῆς, ἀλλὰ τὸ πῶς ἐν τῇ ἀστρονόμεῃ κινηθῆναι φερεται, καὶ τὸ μέγεθος, καὶ τὸ πῶς ἐν τῇ ἀστρονόμεῃ κινηθῆναι φερεται. *lib. 2. c. 13.*

In which the Philosopher do's compendiously reckon up the three chief particulars implied in the Opinion of the *Pythagoreans*. First, the Suns being in the Centre of the

the World. Secondly, the Earth's annual motion about it, as being one of the planets: Thirdly, its diurnal révolution, whereby it caused day and night.

To his second reason I answer: First, that *Pythagoras* thought the Earth to be one of the Planets (as appears by *Aristotles* Testimony concerning him) and to move amongst the rest. So that his Opinion concerning the motion of the Heavens, is not inconsistent with that of the Earth. Secondly, but as for the Coelestial Harmony, he might perhaps under this mystical expression, according to his usual Custom, shadow forth unto us that mutual proportion and Harmonical content, which he did conceive in the several bigness, distance, motions of the Orbs. So that notwithstanding these objections, it is evident that *Pythagoras* was of this Opinion, and that his Authority may add somewhat for the confirmation of it. Unto

him assented * *Aristarchus Samius*, who flourished about 280 years before the Birth of our Saviour, and was by reason of this Opinion, arraigned for Prophaness and Sacrilege by the *Areopagites*, because he had blasphemed the Deity of *Vesta*, affirming the Earth to move. To them agreed *Philolaus*, *Heracledes*, *Ponticus*, *Nicetas*, *Syracusanus*, *Ecphantus*, *Lucippus*, and *Plato* himself (as some think.) So likewise *Numa Pompilius*, as *Plutarch* relates it in his Life; who in reference to this Opinion, built the Temple of *Vesta* round, like the Universe: In the middle of it was placed the perpetual

perpetual vestal Fire; by which he did represent the Sun in the Centre of the World. All these Men were in their several times of special Note, as well for their extraordinary Learning as for this Opinion.

'Tis considerable, that since this Science of *Astronomy* hath been raised to any perfection, there have been many of the best skill in it, that have assented unto that assertion which is here defended. Amongst whom was the Cardinal *Cusanus*, but more especially *Copernicus*, who was a Man very exact and diligent in these studies for above 30 years together, from the year 1500. to 1530. and upwards: And since him, most of the best Astronomers have been of his side. So that now, there is scarce any of note and skill, who are not *Copernicus* his followers, and if we should go to most voices, this Opinion would carry it from any other. It would be too tedious to reckon up the names of those that may be cited for it; I will only mention some of the chief: Such were *Joachinus Rheticus*, an elegant Writer, *Christophorus Rothman*, *Mestlin*, a Man very eminent for his singular skill in this Science; who though at the first he were a follower of *Ptolemy*, yet upon his second and more exact thoughts, he concluded *Copernicus* to be in the right, and that the usual Hypothesis, * *prescriptione* * *Pres. ad potius quam ratione valet*, do's prevail more by prescription than reason. So likewise *Erasmus Reinholdus*, who was the Man that calculated the Prutenical Tables from *Copernicus*.

Ibid.

nicus his observations, and did intend to write a Commentary upon his other Works, but that he was taken out of this Life before he could finish those resolutions. Unto these also I might add the names of *Gilbert*, *Keplar*, *Gallilæus*, with sundry others, who have much beautified and confirmed this *Hypothesis*, with their new inventions. Nay I may safely affirm, that amongst the variety of those Opinions that are in *Astronomy*, there are more (of those which have skill in it) that are of this Opinion, not only than any other, but than all the rest put together. So that now it is a greater Argument of Singularity to oppose it.

3. Consid.

'Tis probable, that many other of the Antients would have assented unto this Opinion, if they had been acquainted with those experiments which later times have found out for the confirmation of it: And therefore * *Rheticus* and † *Keplar* do so often wish that *Aristotle* were now alive again. *Questi-*

* In Narratione.
† *Myt. Cos.* onless he was so rational and ingenious a Man (not half so obstinate as many of his followers) that upon such probabilities as these, he would quickly have renounced his own Principles, and have come over to this side.

de Cæll. 2.
c. 12.

For in one place, having proposed some questions about the Heavens, which were not easie to be resolved: He sets down this rule, that in difficulties, a Man may take a liberty to speak that which seems most likely to him: And in such cases, an aptness to guess at some resolution, for the satisfying

of

of our Philosophical thirst, do's deserve rather to be filed by the name of Modesty, than Boldness. And in another place, he refers the Reader to the different Opinions *Met. lib. 12. cap. 8.* of Astronomers, advising him to examin their several tenents, as well *Endoxus* as *Calippus*; and to entertain that (not which is most antient, but) which is most exact and agreeable to reason. And as for *Ptolomy*, 'tis his *Alm. lib. 13. cap. 2.* counsel, that we should endeavour to frame such suppositions of the Heavens, as might be more simple, being void of all superfluities: And he confesses, that his *Hypothesis* had many implications in it, together with sundry intricate and unlikely turnings; and therefore in the same place, he seems to admonish us, that we should not be too confident the Heavens were really in the same Form, wherein Astronomers did suppose them. So that 'tis likely, 'twas his chief intent to propose unto us such a frame of the *Cœlestial Bodies*, from which we might, in some measure, conceive of their different appearances; and according to which, we might be able to calculate their motions. But now, 'tis *Copernicus* his endeavour, to propound unto us, the true natural Causes of these several Motions, and Appearances: It was the intent of the one, to settle the Imagination; and of the other, to satisfy the judgment. So, that we have no reason to doubt of his assent unto this Opinion, if he had but clearly understood all the grounds of it.

'Tis

'Tis reported of *Clavius*, that when lying upon his Death-bed, he heard the first News of those Discoveries which were made by *Gallilæus* his Glass, he brake forth into these words: *Videre Astronomos, quo pacto constituendi sunt orbes Cælestes, ut hæc Phænomena saluari possint*: That it did behove Astronomers, to consider of some other *Hypothesis*, beside that of *Ptolomy*, whereby they might salve all those new appearances. Intimating that this old one, which formerly he had defended, would not now serve the turn: And doubtless, if it had been informed how congruous all these might have been unto the Opinion of *Copernicus*, he would quickly have turned on that side. 'Tis considerable, that amongst the followers of *Copernicus*, there are scarce any, who were not formerly against him; and such, as at first, had been thoroughly seasoned with the Principles of *Aristotle*; in which, for the most part, they have no less skill, than those who are so violent in the defence of them. Whereas on the contrary, there are very few to be found amongst the followers of *Aristotle* and *Ptolomy*, that have read any thing in *Copernicus*, or do fully understand the Grounds of his Opinion; and I think, not any, who having been once settled with any strong assent on this side, that have afterwards revolted from it. Now if we do but seriously weigh with our selves, that so many ingenious, considering Men, should reject that Opinion which they were nursed up in, and which is generally approved as the truth;

truth; and that, for the embracing of such a *Paradox* as is condemned in Schools, and commonly cried down, as being absurd and ridiculous: I say, If a Man do but well consider all this, he must needs conclude, that there is some strong evidence for it to be found out by examination; and that in all probability, this is the righter side.

'Tis probable, that most of those Authors who have opposed this Opinion, since it hath been confirmed by new Discoveries, were stirred up thereunto by some of these three insufficient Grounds. 7. *Confid.*

1. An over-fond and partial conceit of their proper Inventions. Every Man is naturally more affected to his own Brood, than to that of which another is the Author; though perhaps it may be more agreeable to reason. 'Tis very difficult for any one, in the search of Truth, to find in himself such an indifferency, as that his Judgment is not at all sway'd, by an overweening affection unto that which is proper unto himself. And this perhaps might be the first reason that moved the noble *Tycho*, with so much heat, to oppose *Copernicus*, that so he might the better make way for the spreading of that *Hypothesis*, which was of his own invention. To this I might likewise refer that Opinion of *Origanus*, and Mr. *Carpenter*, who attribute to the Earth, only a diurnal Revolution. It does more especially concern those Men that are *Leaders* of several sides, to beat down any that should oppose them.

2. A fervile and superstitious fear of derogating from the Authority of the Ancients, or opposing that meaning of Scripture phrases, wherein the supposed infallible Church, hath for a long time understood them. 'Tis made part of the new Creed, set forth by *Pius* the Fourth, 1564. That no Man should assent unto any interpretation of Scripture, which is not approved of by the Authority of the Fathers. And this is the reason why the Jesuits, who are otherwise the greatest affectors of those Opinions, which seem to be new and subtil, do yet forbear to say any thing in defence of this; but rather take all occasions to inveigh against it. * One of them does expressly condemn it for a Heresy. And since him, it hath been called in by † two Sessions of the Cardinals, as being an Opinion both absurd and dangerous. And therefore likewise do they punish it, by casting the Defenders of it into the Pope's truest Purgatory, the Inquisition: But yet neither these Councils, nor any (that I know of) since them, have proceeded to such a peremptory censure of it, as to conclude it a Heresy: fearing perhaps, lest a more exact examination, and the discovery of future times, finding it to be an undeniable Truth, it might redound to the prejudice of their Church, and its Infallibility. And therefore he that is most bitter against it, in the heat and violence of Opposition, will not call it a Heresy: the worst that he dares say of it, is,

That

* *Serrarius*
in *Com-*
men. in
J. S. c. 10.
Quest. 14.
So *Lipsius*
Philosol. l. 2.
† *A. D. 1616*
1616 item
1633.

That it is, *Opinio temeraria, que altero saltem pede intravit Haresios limen*; A rash Opinion, and bordering upon Heresy. Though unto this likewise he was incited, by the eagerness of Disputation, and a desire of Victory; for it seems many eminent Men of that Church before him, were a great deal more mild and moderate in their censures of it.

Paul the Third, was not so much offended at *Copernicus*, when he dedicated his Work unto him.

The Cardinal of *Cusa*, does expressly maintain this Opinion.

Schombergius, the Cardinal of *Capua*, did, with much importunity, and great approbation, beg of *Copernicus* the Commentaries that he writ in this kind. And it seems the Fathers of the Council of *Trent*, were not such confident Defenders of *Ptolemy's Hypothesis* against *Copernicus*, as many now are. For speaking of those intricate Subtilties, which the Fancies of Men had framed, to maintain the practice of the Church, they compared them to Astronomers, who (say they) do fain *Excentricks* and *Epicycles*, and such Engines of the Orbs, to save the *Phænomena*; though they know there are no such things. But now, because this Opinion of *Copernicus*, in later times, hath been so strictly forbidden, and punished, it will concern those of that Religion, to take heed of meddling in the defence of it, but rather to submit the liberty of their Reason, unto the

Tromondus
Anta-
rist. cap. 6.

Command of their Superiors, and (which is very absurd) even in natural Questions, not to assent unto any thing, but what Authority shall allow of.

3. A judging of things by Sense, rather than by Discourse and Reason: a tying of the meaning of Scripture, to the Letter of it; and from thence concluding Philosophical Points, together with an ignorance of all those grounds and probabilities in Astronomy, upon which this Opinion is bottomed. And this, in all likelihood, is the reason why some Men, who in other things perhaps are able Scholars, do write so vehemently against it: and why the common People in general do cry it down, as being absurd and ridiculous. Under this head I might refer the opposition of Mr. Fuller, *Al. Ross.* &c.

But now, no prejudice that may arise from the bare Authority of such Enemies as these, will be liable to sway the judgment of an indifferent considering Man; and I doubt not but that he who will thoroughly weigh with himself these Particulars that are here propounded, may find some satisfaction for these Arguments, which are taken from the seeming Novelty and Singularity of this Opinion.

PROP.

PROP. II.

That there is not any place in Holy Scripture, from which (being rightly understood) we may infer the Diurnal Motion of the Sun or Heavens.

IT were happy for us, if we could exempt Scripture from Philosophical Controversies: if we could be content to let it be perfect for that end unto which it was intended, for a Rule of our Faith and Obedience; and not stretch it also to be a Judge of such natural Truths, as are to be found out by our own industry and experience. Though the Holy Ghost could easily have given us a full resolution of all such particulars; yet he hath left this travel to the Sons of Men to be exercised therewith; *Mundum reliquit disputationibus Hominum*; that being busied, for the most part, in an inquisition after the Creatures, we might find the less leisure to wait upon our Lusts, or serve our more sinful Inclinations.

*Eccles. 3:
10, 11.*

But however, because our Adversaries generally do so much insult in those Arguments that may be drawn from hence; and more especially, because *Pineda* doth for this reason, with so many bitter and empty reproaches, revile our learned Countryman,

*Comment.
in Eccl.
c. 1. v. 4.*

Dr. Gilbert, in that renewing of this Opinion, he omitted an answer to the Scripture-Expression: therefore 'tis requisite, That in the prosecuting this Discourse, we should lay down such satisfaction, as may clear all Doubts that may be taken thence: especially since the prejudice that may arise from the misapprehension of those Scripture-Phrases, may much disable the Reader from looking on any other Argument, with an equal and indifferent mind.

The places that seem to oppose this, are of two kinds. First, Such as imply a Motion in the Heavens: Or, secondly, such as seem to express a Rest and Immobility in the Earth.

Those of the first kind seem to bear in them the clearest evidence, and therefore are more insisted on by our Adversaries. They may be referred unto these three Heads.

1. All those Scriptures where there is any mention made of the Rising or Setting of the Sun or Stars.

2. That story in *Josbna*, where the Sun standing still, is reckoned for a Miracle.

3. That other Wonder in the days of *Hezekiah*, when the Sun went back ten degrees in the Dial of *Ahaz*. All which places do seem to conclude, That the Diurnal Motion is caused by the Heavens.

To this I answer in general;

That the Holy Ghost, in these Scripture-expressions, is pleased to accommodate himself

self

self unto the conceit of the Vulgar, and the usual Opinion: whereas, if in the more proper phrase it had been said, That the Earth did rise and set; or, that the Earth stood still, &c. the People who had been unacquainted with that secret in Philosophy, would not have understood the meaning of it, and therefore it was convenient, that they should be spoken unto in their own Language.

Ay, but you will reply, It should seem more likely, if there had been any such thing, that the Holy Ghost should use the truest expressions: for then he would at the same time have informed them of the thing, and reformed them in an error: since his Authority alone had been sufficient to have rectified the Mistake.

I answer: 1. Though it were, yet 'tis beside the chief scope of those places, to instruct us in any Philosophical Points, as hath been proved in the former Book; especially when these things are neither necessary in themselves, nor do necessarily induce to a more full understanding of that which is the main business of those Scriptures. But now the People might better conceive the meaning of the Holy Ghost, when he does conform himself unto their Capacities and Opinions, than when he talks exactly of things in such a proper phrase, as is beyond their reach: And therefore 'tis said in *Isaiah*, *I am the Lord, which teacheth thee utilia, profitable things*: where the gloss has it, *non subtilia*.

tilia, not such curiosities of Nature as are not easily apprehended.

2. 'Tis not only besides that which is the chief purpose of those places, but it might happen also to be somewhat opposite unto it. For Men being naturally unapt to believe any thing that seems contrary to their senses, might upon this begin to question the Authority of that Book which affirmed it, or at least to wrest Scripture some wrong way, to force it to some other sence which might be more agreeable to their own false Imagination. * *Tertullian* tells us of some Hereticks, who when they were plainly confuted out of any Scripture, would presently accuse those Texts or Books to be Fallible, and of no Authority; and rather yield Scripture to be erroneous, than forgo those Tenents for which they thought there was so good reason. So likewise might it have been in these Points, which seem to bear in them so much contradiction to the senses and common opinion: and therefore 'tis excellent advice set down by * *S. Austin*; *Quod nihil credere de re obscura tenere debemus, ne forte quod postea veritas patefecerit, quamvis libris sanctis, sive Testamenti veteris, sive novi, nullo modo esse possit adversum, tamen propter amorem nostri erroris oderimus*: That we should not hastily settle our Opinions concerning any obscure matter, lest afterwards, the Truth being discovered, (which however it may seem, cannot be repugnant to any thing in Scripture) we should

* *Præscript*
cap. 17.

* *In Genes.*
Addit. l. 2.
in fine.

should hate that, out of love to the Error that we have before entertained. A little reading may inform us how these Texts have been abused to strange and unmeant Allegories, which have mentioned any natural Truth in such a manner as was not agreeable to Mens Concepts. And besides, if the Holy Ghost had propounded unto us any Secrets in Philosophy, we should have been apt to be so busied about them, as to neglect other Matters of greater importance. And therefore Saint *Austin* proposing the Question, What should be the reason why the Scripture does not clearly set down any thing concerning the Nature, Figure, Magnitude, and Motion of the Heavenly Orbs? he answers it thus: The Holy Ghost being to deliver more necessary Truths, would not insert these, lest Men, according to the pravity of their Dispositions, should neglect the more weighty Matters, and bestow their thoughts about the speculative natural Points, which were less needful. So that it might seem more convenient, that the Scripture should not meddle with the revealing of these unlikely Secrets, especially when it is to deliver unto us many other Mysteries of greater necessity, which seem to be directly opposite to our sense and reason. And therefore, I say, the Holy Ghost might purposely omit the treating of these Philosophical Secrets, till time and future discovery, might with leisure settle them in the opinion of others: As he is pleased, in other things

Ibid. cap. 9

things of a higher kind, to apply himself unto the Infirmary of our Apprehensions, by being represented, as if he were a humane Nature, with the parts and passions of a Man. So in these things likewise, that he might descend to our Capacities, does he vouchsafe to conform his Expressions, unto the error and mistake of our Judgments.

But before we come to a further illustration, let us a little examine those particular Scriptures, which are commonly urged to prove the motion of the Sun or Heavens. These (as was said) might be distributed under these three Heads.

1. Those places which mention the Rising or Setting of the Sun, as that in the
 * Psal. 19. * Psalm, *The Sun, like a Bridegroom, cometh out of his Chamber, and rejoiceth as a Giant to run his Race: His going forth is from the end of Heaven, and his Circuit unto the end of it, and there is nothing hid from the heat thereof.* And that in Ecclesiastes, *The Sun riseth, Eccles. 1. 5. and the Sun goeth down, &c.*

In which Scriptures, we may observe divers Phrases that are evidently spoken, in reference to the appearance of things, and the false opinion of the Vulgar. And therefore 'tis not altogether unlikely, That this which they seem to affirm concerning the Motion of the Heavens, should also be understood in the same sense.

The Sun like a Bridegroom cometh out of his Chamber; alluding perhaps unto the conceit of

of ignorant People, as if it took rest all the while it was absent from us, and came out of its Chamber, when it arose.

And rejoiceth as a Giant to run his Race; because in the morning it appears bigger than at other times; and therefore in reference to this appearance, may then be compared unto a Giant.

His going forth is from the end of Heaven, and his Circuit unto the ends of it. Alluding again unto the opinion of the Vulgar; who not apprehending the roundness of the Heavens, do conceive it to have two ends; one where the Sun riseth, the other where it setteth.

And there is nothing hid from the heat thereof: speaking still in reference to the common mistake, as if the Sun were actually hot in it self; and as if the heat of the Weather were not generated by reflection, but did immediately proceed from the body of the Sun.

So likewise, for that in Ecclesiastes, where 'tis said, *The Sun riseth, and the Sun goeth down, &c.* Which phrases being properly understood, do import, that he is sometimes in a higher place than at others: whereas, in a circumference, there is no place higher or lower, each part being at the same distance from the Centre, which is the bottom. But now understand the phrase in reference to the Sun's appearance, and then we grant that he does seem sometimes to rise, and sometimes to go down, because in

in reference to the Horizon, (which common People apprehend to be the bottom, and in the utmost bounds of it to join with the Heavens) the Sun does appear in the Morning to rise up from it, and in the Evening to go down unto it. Now, I say, because the Holy Ghost, in the manner of these expressions, does so plainly allude unto vulgar Errors, and the false appearance of things: therefore 'tis not without probability, that he should be interpreted in the same sense, when he seems to imply a motion in the Sun or Heavens.

2. The second place, was that relation in *Joshua*; where 'tis mentioned as a Miracle, That the Sun did stand still. And *Joshua* said, *Sun, stand thou still upon Gibeon, and thou Moon in the Valley of Ajalon. So the Sun stood still in the midst of Heaven, and hastened not to go down about a whole day. And there was no day like that, before it, or after it.* In which place likewise, there are divers phrases wherein the Holy Ghost does not express things according to their true nature, and as they are in themselves; but according to their appearances, and as they are conceived in common opinion. As,

Josh. 10. 12, 14. Galileus maintains the literal sense of this place; towards the end of that treatise, which he calls *Nov. Ansig. pat. doctrina.*

(1.) When he says, *Sun, stand thou still upon Gibeon, or over Gibeon.* Now the whole Earth being so little in comparison to the body of the Sun, and but as a Point, in respect of that Orb wherein the Sun is supposed to move; and *Gibeon* being, as it were, but

but a Point of this Globe of Earth: therefore the words cannot be understood properly, but according to appearance. 'Tis probable that *Joshua* was then at *Azecha*, a little East from *Gibeon*, and the Sun being somewhat beyond the Meridian, did seem unto him, as he was in that place, to be over against *Gibeon*; and in reference to this appearance, and vulgar conceit, does he command it to stand still upon that place.

(2.) And so, secondly, for that other expression; *And thou Moon in the Valley of Ajalon.* This Planet was now a little East from the Sun, it being about three or four dayes old, as Commentators guess. *Ajalon* was three miles from *Gibeon* Eastward, and *Joshua* commanded the Moon to stand still there; because unto him it did then seem to be over against that Valley; whereas, 'tis certain, if he had been there himself, it would still have seemed to be as much distant from him. Just as Men commonly speak in shewing another the Stars; we point to a Star over such a Chimney, or such a Tree, because to us it appears so; whereas the Star in it self is not sensibly more over them, than it is over us. So that in this phrase likewise the Holy Ghost doth conform himself unto the appearance of things, and our grosser conceit.

(3.) *And the Sun stood still in the midst of Heaven.* Now to speak properly, and as the thing is in it self, Heaven has no midst but the Centre; and therefore, this also must

Tostati in locum. Quæst. 16, 17. Arias Montanus in locum.

Tostati. ib. Quæst. 18. Serrarius in Josh. 10. Quæst. 21, 22.

must be interpreted in reference to the opinion of the Vulgar; and by the midst of Heaven, we are to understand such a place as was not very near to either of the ends, the East or West.

(4.) *And there was no day like that, before it, or after it:* Which words are not to be understood absolutely, for there are always longer days under the Poles: but in respect to the opinion of the Vulgar, that is, there was never any day so long which these ignorant People knew of.

2 King 20.
11,
Isa. 38.8.

3. As for this last place, concerning the Sun's returning ten degrees in the Dial of *Ahaz*; I think it may probably be affirmed, That it is to be understood only concerning the Shadow: which though it do necessarily happen in all Horizontal Dials, for any Latitude betwixt the Tropicks: And so consequently in all Declining Dials, the Elevation of whose Pole is less than the Sun's greatest Declination; as *Clavius, de Horol. cap. 21.* observes: Yet the Circumstances of this relation in Scripture, makes the Event to differ from that other which is common and natural; which against its nature did seem to go backwards, when as the Sun it self was not in the least manner altered from its usual course. Of this opinion were *Albarbinell, Arius Montanus, Burgensis, Vatablus Sanctius, &c.*

The Reasons for it may be these;

1. The Miracle is proposed only concerning the Shadow; *Wilt thou that the Shadow shall*

shall ascend or return by ten degrees? There being not in the offer of this Wonder, any the least mention made concerning the Sun's going backwards.

2. 'Tis likely we should have had some intimation concerning the extraordinary length of the Day, as it is in that of *Joshua*; but in this relation, the chief matter that the story takes notice of, is the alteration of the Shadow.

3. Had it been by the supposed return of the Sun's Body, this had been a greater Miracle, than those which were performed upon more solemn occasions; it had been more wonderful than its seeming rest in *Joshua's* time; than the supernatural Eclipse at our Saviour's Death, when the Moon was in the full. And then it is not likely, that the Holy Ghost, in relating of this Miracle, should chiefly insist in expressing how the Shadow returned, and that only in the Dial of *Ahaz*.

4. This Sign did not appear in the Sun it self; because in *2 Chron. 32. 31.* 'tis said, That the *Embassadors of the King of Babylon did come unto Hezekiah, to enquire of the Wonder that was done in the Land*; and therefore it seems the Miracle did not consist in any change of the Heavens.

5. If it had been in the Sun, it would have been as well discerned in other parts of the World, as in the Land of *Juda*. And then,

1. What

1. What need the King of *Babylon* send thither to enquire after it? If you reply, because it was occasioned by *Hezekiah's* Recovery, I answer, 'Tis not likely that the Heathens would ever believe so great a Miracle should be wrought, meerly for a Sign of one Man's recovery from a Disease; but would rather be apt to think that it was done for some more remarkable purpose, and that by some of their own Gods, unto whom they attributed a far greater power, than unto any other. 'Tis more probable, that they might hear some flying Rumour of a Miracle that was seen in *Judea*; which, because it hapned only in *Hezekiah's* House and Dial, and that too upon his recovery from a dangerous sickness, they might be more apt to believe that it was a sign of it.

2. Why have we no mention made of it in the Writings of the Ancients? It is no way likely, that so great a Miracle as this was (if it were in the Sun) should have been passed over in silence; Especially, since it hapned in those later Times, when there were many Heathen Writers that flourished in the World, *Hesiod*, *Archilochus*, *Symonides*; and not long after, *Homer*, with divers others; and yet none of them have the least mention of any such Prodigy. We have many relations of Matters that were less observable, which were done about that Time; the History of *Numa Pompilius*, *Gyges*; the fight betwixt the three Brethren, with

With divers such Stories. And 'tis scarce credible, that this should have been omitted amongst the rest.

Nay, we have (as many guess) some hints from prophane Antiquity, of the Miracle wrought by *Joshua*. Unto which, 'tis thought, the Ancients did allude, in the Fable of *Phaëton*, when the Sun was so irregular in his course; that he burnt some part of the World. And questionless then, this which hapned in later Times, would not have been so wholly forgotten. 'Tis an Argument urged by * *Origen*, That the Eclipse at our Saviour's Passion was not universal, because no prophane Author of those times mentions it. Which Consequence is the very same with that which is urged in this case: But by the way, his Antecedent was false, since † *Tertullian* affirms, That it was recorded among the Roman *Annals*.

* *Tractat.*
35. *in Mar*

† *Apolog.*
cap. 21.

Lib. 2.

Now, as for that story in *Herodotus*, where after he had related the flight of *Senacherib*, he tells us, how the Sun did, four times in the space of 10340 Years, invert his course, and rise in the West; which would seem so unto other Nations, if he had only returned, as many conclude, from this Scripture. As for this story, (I say) it cannot well be urged as pertinent to the present business, because it seems to have reference unto Times that never were.

So that all these things being well considered, we shall find it more probable, that

D

this

this Miracle doth consist in the return of the Shadow.

Iſa. 38 8.

Jona. 4 8.

Jona. 4 8.

Pſal. 121.

6.

If you Object, That the Scripture does expreſſly ſay, *The Sun it ſelf returned ſen degrees*. I answer, 'Tis a frequent manner of ſpeech in Scripture, to put the Cauſe for the Effect; as that in *Jonas*, where 'tis ſaid, *That the Sun did beat upon the Head of Jonas*; that is, the Beams of the Sun. So that of the *Pſalmiſt*, *The Sun ſhall not ſmite thee by Day*; that is, the heat which proceeds from the Sun's reflection. In the ſame ſenſe may the phraſe be underſtood in this place; and the Sun may be ſaid to return back, becauſe the Light, which is the effect of it, did ſeem to do ſo; or rather, becauſe the Shadow, which is the effect of that, did change its courſe.

This later Scripture then, will not at all make to the preſent purpoſe: as for thoſe of the two former kinds, I have already answered, That they are ſpoken in reference to the appearance of things, and vulgar Opinion. For the further illuſtration of which, I ſhall endeavour to confirm theſe two particulars.

1. That the Holy Ghoſt, in many other places of Scripture, does accommodate his Expreſſions, unto the error of our Conceits; and does not ſpeak of divers things as they are in themſelves, but as they appear unto us. Therefore 'tis not unlikely, that theſe Phraſes alſo may be liable unto the ſame interpretation.

2. That

2. That divers Men have fallen into great Abſurdities, whiſt they have looked for the Grounds of Philoſophy, from the words of Scripture; and therefore it may be dangerous, in this Point alſo, to adhere ſo cloſely unto the Letter of the Text.

PROP. III.

That the Holy Ghoſt, in many places of Scripture, does plainly conform his Expreſſions unto the Errors of our Conceits; and does not ſpeak of divers things as they are in themſelves, but as they appear unto us.

There is not any particular by which Philoſophy hath been more endamaged, than the ignorant ſuperſtition of ſome Men; who, in ſtating the Controverſies of it, do ſo cloſely adhere unto the meer words of Scripture. *Quamplurima occurrunt in libris ſacris ad naturam pertinentia, &c.* They are the words of * *Valleſius*. 'There are ſundry things in Holy Writ, concerning Natural Points, which moſt Men think are not ſo to be underſtood, as if the Holy Ghoſt did intend to unfold unto us any thing in that kind: but referring all to the ſalvation of our Souls, does ſpeak of other matters according to common Opinion. And

* *Pro. an.
ad Phil.
Sacram.*

a little after, *Ego, divina hac eloquia, &c.*
 'I for my part am persuaded, that these
 'Divine Treatises, were not written by the
 'Holy and Inspired Pen-men, for the Inter-
 'pretation of Philosophy, because God left
 'such things to be found out by Mens labour
 'and industry. But yet, whatsoever is in
 'them concerning nature, is most true; as
 'proceeding from the God of Nature, from
 'whom nothing could be hid. And ques-
 'tionless, all those things which the Scrip-
 'ture does deliver concerning any natural
 Point, cannot be but certain and infallible,
 being understood in that sense, wherein
 they were first intended; but now that it
 does speak sometimes according to common
 opinion, rather than the true nature of the
 things themselves, was intimated before;
 wherefore (by the way) * *Fromondus* his
 triumph upon the latter part of this Quo-
 tation, is but vain, and to no purpose. 'Tis
 a good rule set down by a learned † Com-
 mentator, to be observed in the interpreta-
 tion of Scripture: *Scriptura sacra sapè non*
tam ad veritatem ipsam, quam ad hominum opi-
nionem, sermonem accommodat; that it does
 many times accommodate its expressions,
 not so much to the Truth it self, as to Mens
 Opinions. And in this sense is that Speech
 of *Gregory* concerning Images and Pictures,
 attributed by † *Calvin* unto the History of
 the Creation, viz. *Librum esse idiotarum*;
 That it is a Book for the simpler and igno-
 rant People. For it being written to in-
 form

* *Vest.*
Trac. 3.
cap. 2.

Zachar.
lib. 9. num.
45.

‡ *Cin. ment*
in Ge. 1.

form them, as well as others, 'tis requisite
 that it should use the most plain and easy
 expressions. To this purpose likewise is that
 of * *Mersennus*, *Mille sunt Scripturae loca, &c.*
 'There are very many places of Scripture,
 'which are not to be interpreted according
 'to the Letter; and that for this reason,
 'because God would apply himself unto our
 'capacity and sense: *Præsertim in iis, quæ*
ad res naturales, oculisque subjectas pertinent;
 more especially in those things which con-
 cern Nature, and are subject to our Eyes.
 And therefore in the very same place, tho
 he be eager enough against *Copernicus*, yet
 he concludes that Opinion not to be a Here-
 sy; because (saith he) those Scriptures
 which seem to oppose it, are not so evident,
 but that they may be capable of another In-
 terpretation: Intimating, that it was not
 unlikely they should be understood in refe-
 rence to outward appearance, and common
 opinion: And that this manner of speech is
 frequently used in many other places of
 Scripture, may be easily manifest from these
 following Examples. Thus tho the Moon
 may be proved, by infallible observation, to
 be less than any of the visible Stars; yet
 because of its appearance, and vulgar opi-
 nion, therefore doth the Scripture, in Com-
 parison to them, call it one of the Great
 Lights. Of which place, saith *Calvin*, *Mo-*
ses populariter scripsit, nos potius respexit quam
sydera. *Moses* did not so much regard the
 Nature of the thing, as our Capacity; and
 there-

* *In Gen.*
c. 1. v. 10.

Gen. 1. 16.
Ps. 136. 7.

therefore uses a popular phrase : so as ordinary People, without the help of Arts and Learning, might easily understand him. And in another place, *Non fuit Spiritus Sancti concilium Astrologiam docere* : 'It was not the purpose of the Holy Ghost to teach us Astronomy : but being to propound a Doctrine, that concerns the most rude and simple People, he does (both by *Moses* and the Prophets) conform himself unto their phrases and conceits : lest any should think to excuse his own ignorance with the pretence of difficulty ; as Men commonly do in those things which are delivered after a learned and sublime manner. Thus

** De opt. Zanchy* * likewise, *Moses majorem rationem tribus Dei, habuit nostri humanique iudicii, &c.* 'When *Moses* calls the Moon a Great Light ; he had a more especial reference to Mens Opinions of it, than to the truth of the thing it self, because he was to deal with such, who do judg usually, rather by their Sense, than by their Reason. Nor will that distinction of *Fromondus*, and others, avoid this interpretation, when he tells us of *Magnus Materialis* ; which refers to the bulk and quantity of the Body : and *Magnum Formale*, which imports the greatness of its Light. For we grant, that it is really unto us a greater Light than any of the Stars, or than all of them together : yet there is not any one of them, but is in it self a bigger Light than this : And therefore, when we say this speech is to be understood according to its ap-

Comment.
in Pl. 136.

* De opt.
tribus Dei,
par. 2. li. 6.
cap. 1.

appearance, we do not oppose this to reality ; but 'tis implied, that this reality is not absolute, and in the nature of the thing it self, but only relative, and in reference to us. I may say, a Candle is a bigger Light than a Star, or the Moon, because it is really so to me. However any one will think this to be spoken, only in relation to its appearance, and not to be understood as if the thing were so in it self. But (by the way) it does concern *Fromondus* to maintain the Scripture's Authority, in revealing of natural Secrets ; because, from thence it is that he fetches the chief Argument for that strange Assertion of his, concerning the heaviness of the Wind ; where *Job* says, that *God makes the weight for the Wind*. Thus likewise, because the common People usually think the Rain to proceed from some Waters in the *Expansum* : therefore doth *Moses*, in reference to this erroneous Conceit, tell us of Waters above the Firmament, and the Windows of Heaven : Of which, saith *Calvin*, *Nimis serviliter litera se astingunt, &c.* 'Such Men too servilely tie themselves unto the Letter of the Text, who hence conclude, that there is a Sea in the Heavens : when as we know, that *Moses* and the Prophets, to accommodate themselves unto the capacity of ruder People, do use a vulgar expression ; and therefore it would be a preposterous course, to reduce their phrases unto the exact Rules of Philosophy. Let me add, that from this

mistake,

De Meteor.
lib. 4. c. 2.
art. 5.

Job 28. 25

Comment.
in Psalm.
148. 4.

mistake, 'tis likely did arise that groundless observation of the ancient Jews; who would not admit any to read the beginning of *Genesis*, till he was arrived to thirty Years of Age. The true reason of which, was this; not because that Book was harder than any other; but because *Moses* conforming his expression to vulgar Conceits, and they examining of them by more exact rules of Philosophy, were fain to force upon them many strange Allegories, and unnatural Mysteries.

Thus also, because for the most part we conceive the Stars to be innumerable, therefore doth the Holy Ghost often speak of them in reference to this opinion. So *Jeremy*, *As the Hoast of Heaven cannot be numbered, neither the Sand of the Sea measured, so will I multiply the Seed of David*: So likewise when God would comfort *Abraham* with the promise of a numberless Posterity, he bids him look up to Heaven, and tells him, that his Seed should be like those Stars for number: Which, saith * *Clavius*, *Intelligendum est secundum communem sententiam vulgi, existimantis infinitam esse multitudinem stellarum, dum eas nocte serena confusè intuerur*; is to be understood according to the common opinion of the Vulgar, who think the Stars to be of an infinite multitude, whilst they behold them all (as they seem confused) in a clear Night. And though many of our Divines do commonly interpret this Speech to be a *Hyperbole*; yet being well considered,

we

we shall find that *Abraham's* Posterity, in some few Generations, were far more than there are visible Stars in the Firmament; and of such only does God speak, because he bids *Abraham* look up to the Heavens.

Now all these, even unto six differences of Magnitude, are reckoned to be but 1022. True indeed, at the first viewing of the Heavens, it may seem an incredible thing, that they should be of no greater a number; but the reason of this is, because they appear scattered and confused; so that the eye cannot place them in any such order, as to reckon them up, or take any distinct survey of them. Now 'tis a known truth, *Quod fortius operatur pluralitas partium, ubi ordo abest; nam inducit similitudinem infiniti, & impedit comprehensionem*: That a plurality of parts, without order, has a more strong operation, because it has a kind of seeming infinity, and so hinders comprehension. And then besides, there are more appearances of Stars many times, than there are bodies of them; for the Eye, by reason of its weakness and disability, to discern any thing at so great a distance; as also, because of those Beams which proceed from such remote Bodies, in a twinkling and wavering manner, and so mix and confound themselves at their entrance into that Organ; it must needs receive more representations than there are true bodies. But now, if a Man do but leisurely and distinctly compare the Stars of the Heaven with those of this number, that are

Sir F. Bac.
Table of
Colours,
numb. 5.

Gen. 15. 5.
* In i. cap.
Sphere.

are noted in a Coelestial Globe, he shall scarce find any in the Sky which are not marked with the Globe; nay, he may observe many in the Globe, which he can scarce at all discern in the Heavens.

Now this number of the Stars, is commonly distributed into 48 Constellations; in each of which, though we should suppose ten thousand Stars, (which can scarce be conceived) yet would not all this number equal that of the Children of *Israel*. Nay, 'tis the assertion of *Clavius*, that *Abraham's* Posterity, in some few Generations, were far more than there could be Stars in the Firmament, though they stuck so close that they touched one another: And he proves it thus; A great Circle in the Firmament, does contain the diameter of a Star of the first Magnitude 14960 times. In the Diameter of the Firmament, there are contained 4760 Diameters of such a Star: Now if we multiply this for a Diameter, the Product will be 71209600, which is the full number of Stars, that the eighth Sphere (according to *Ptolomy's* grounds) would contain, if they stood so close that they touched one another.

Num. 1. 46 The Children of *Israel* were reckoned, at their going out of *Egypt*, 603550, of such as were one and twenty Years old, and upwards, and were able to go to War; besides Children, and Women, and Youths, and old Men, and the Levites; which in probability, did always treble the other number.

ber. Now if they were so many at one time, we may well conceive, that in all those several Generations, both before and since, the number was much augmented; and long before this time, did far exceed this supposed multitude of the Stars. From all which we may infer, that the Scripture-expressions in this kind, are to be understood according to appearance and common opinion.

Another place usually cited for the same purpose, to shew that the Holy Ghost does not speak exactly concerning natural Secrets; is that in the *Kings* and *Chronicles*, which relates unto us the measure of *Solomon's* brazen Sea, whose Diameter was ten Cubits, and its circumference thirty; whereas to speak Geometrically, the more exact proportion betwixt the Diameter and the Circumference, is not as ten to thirty, but rather as seven to twenty two.

But against this 'tis * objected by our Adversaries,

* *Ross. l. 1. sect 1. c. 8.*

1. This Sea was not perfectly round, but rather inclining to a semicircular Form, as *Josephus* affirms.

Ant. Jud. lib. 8. c. 2.

I reply: If it were so, yet this is so much from helping the matter, that it makes it much worse; for then the disproportion will be far greater.

But secondly, Scripture, which is to be believed before *Josephus*, does tell us in express terms, that it was round all about, *1 King. 7. 23.*

Ross. *ibid.* 2 The proportion of the Diameter to the Circumference, is not exactly the same as seven to two and twenty, but rather less. I answer, Though it be, yet 'tis nearer unto that, than any other number.

ibid. 3. The Scripture does but according to its usual custom, suppress the less number, and mention only that which is bigger and more full. So in some * places, *Abraham's* Posterity is said to remain in the Land of *Egypt* for four hundred Years; when as notwithstanding † other Scriptures tell us, that they tarried there thirty Years longer. † Exod. 12. 41. Gal. 3. 17. Thus likewise in one * place, the number of * Gen. 46. *Jacob's* House, who came into *Egypt*, is reckoned to be seventy; whereas † else- † 17. † A& 7. 4. where, they are said to be seventy five.

I answer: All this is so far from destroying the force of the present Argument, that it does rather confirm it, and more clearly evidence unto us, that the Scripture does not only, not speak exactly in these subtil and more secret Points of Philosophy, but also, in the ordinary obvious numbring of things, does conform unto common custom, and often use the round number for the whole.

† Fro- 4. 'Tis yet objected by † another Adver- mond. Vc- fary, That we have no reason to expect, the fl. 4. trac. Holy Ghost should reveal unto us this Secret in Nature, because neither *Archimedes*, nor any other, had then found it out. I reply, and why then should we think that the Scripture must needs inform us of the Earths Mo-

Motion; when as neither *Pythagoras*, nor *Copernicus*, nor any else, had then discovered it?

5. In taking the compass of this Vessel, *ibid.* they measured somewhat below the brim, where it was narrower than at the top, and so the Circumference there, might be exactly but thirty Cubits; whereof its Diameter was ten.

I answer: 'Tis evident this is a meer shift, there being not the least ground for it in the Text. And then besides, why might not we affirm, That the Diameter was measured from that place, as well as the Circumference? since 'tis very probable, that the Holy Ghost did speak *ad idem*; and not tell us the breadth of one place, and the compass of another. So that all our Adversaries' Evasions cannot well avoid the force of the Argument that is taken from this Scripture.

Again, common People usually conceive the Earth to be such a Plain, as in its utmost parts is terminated by the Heavens, so that if a Man were in the farthest Coasts of it, he might touch the Sky. And hence also, they think that the reason why some Countries are hotter than others, is, because they lie nearer unto the Sun. Nay, *Strabo* tells us of some Philosophers too, who in this Point have grossly erred; affirming, that there was a place towards the utmost Coasts of *Lusitania*, where a Man might hear the noise that the Sun made, as he quench'd his Beams

Beams in his descent to the Ocean; which, though it be an absurd mistake, yet we may note, that the Holy Ghost, in the expression of these things, is pleased to conform himself unto such kind of vulgar and false Conceits; and therefore, often speaks of the * *Ends of the Heaven*, and the † *Ends of the World*. In this sense, they that come from any far Country, are said to come from the *End of Heaven*, Isa. 13. 5. And in another place, *From the Side of the Heavens*, Deut. 4. 32. All which Phrases do plainly allude unto the error of vulgar Capacities, (saith *Sauvignus*) which hereby is better instructed, than it would be by more proper expressions.

Thus likewise, because ignorant People cannot well apprehend how so great a weight as the Sea and Land, should hang alone in the open Air, without being founded upon some *Basis* to uphold it: therefore in this respect also, does Scripture apply it self unto their Conceits, where it often mentions the *Foundations of the Earth*. Which Phrase, in the Letter of it, does manifestly allude unto Mens Imaginations in this kind.

Thus also the common People usually conceive the Earth to be upon the Water; because, when they have travelled any way as far as they can, they are at length stopped by the Sea. Therefore doth Scripture, in reference to this, affirm, That God stretched the Earth upon the Waters; founded the Earth

upon

upon the Seas, and established it upon the Floods: Of which Places, saith *Calvin*, *Non disputat Philosophice David, de terra sita; sed populariter loquens, ad rudium captum se accommodat*: 'Twas not *David's* intent to speak philosophically concerning the Earth's situation; but rather, by using a popular Phrase, to accommodate his Speech unto the Capacities of the ruder People.

In this sense likewise are we to understand all those places of Scripture, wherein the Coasts of Heaven are denominated from the relations of Before, Behind, the right hand, or the left. Which do not imply (saith * *Scaliger*) any absolute difference in such places, but are spoken meerly in reference to Mens estimations, and the common opinion of those People, for whom the Scriptures were first penned. Thus because it was the opinion of the Jewish Rabbies, that Man was created with his Face to the East: therefore the Hebrew word קדמ, signifies *Ante*, or the East; אחור, *Post*, or the West; ימין, *Dextra*, or the South; שמאל, *Sinistra*, or the North. You may see all of them put together in that place of *Job*, *Behold, I go forward, and he is not there; and backward, but I cannot perceive him; on the left hand, where he dasheth work; but I cannot behold him. He hideth himself on the right hand, that I cannot see him.* Which expressions, are by some Interpreters referred unto the four Coasts of Heaven, according to the common use of those original words. From

hence

Mat. 25. 33

Job 26.
6, 7.

hence it is, that many of the Ancients have concluded Hell to be in the North; which is signified by the left hand: unto which side our Saviour tells us, that the Goats shall be divided. Which opinion likewise seems to be favoured by that place in *Job*; where 'tis said, *Hell is naked before God, and destruction hath no covering.* And presently 'tis added, *He stretched out the North over the empty place.* Upon these grounds, St. Jerome interprets that Speech of the Preacher, *Eccles. 11. 3. If the Tree fall toward the South, or towards the North, in the place where the Tree falleth, there shall it be.* Concerning those who shall go either to Heaven or Hell. And in this sense also does some expound that of *Zachary 14. 4.* where 'tis said; *that the Mount of Olives shall cleave in the midst; half of it shall remove towards the North, and half of it towards the South.* By which is intimated, that amongst those Gentiles, who shall take upon them the Profession of Christ; there are two sorts; Some that go to the North, that is, to Hell; and others to the South, that is, to Heaven. And therefore it is (say they) that God so * often threatens Evil out of the North: And upon this ground it is, (saith † *Besoldue*) that there is no Religion that worships that way. We read of the *Mahumetans*, that they adore towards the South; the *Jews* towards the West; *Christians* towards the East, but none to the North.

But

But of this only by the way. However, certain it is, that the Holy Ghost does frequently in Scripture set forth the several Coasts of Heaven by those relative terms of right hand and left hand, &c. which expressions do not denote any real intrinsecal difference between those places, but are rather fitted for the apprehension of those Men, from whose fancy it is that they have such denominations. And though *Aristotle* concludes these several Positions to be natural unto the Heavens, yet his Authority in this particular is not available, because he delivers it upon a wrong ground, supposing the Orbs to be living Creatures, and assisted with Intelligences. We may observe, that the meaning of these Coasts, by the relations of right hand and left hand, &c. is so far from having any ground in the nature of those several places, that these relations are not only variously applied unto them by divers Religions (as was said before) but also by divers Arts and Professions. Thus, because *Astronomers* make their Observations towards the South parts of the Horizon, where there be most Stars that rise and set; therefore do they account the West to be at their right hand, and the East their left. The *Cosmographers*, in taking the Latitude of Places, and reckoning their several Climates, must look towards the North Pole; and therefore, in their phrase, by the right hand, is meant the East; and by the left hand, the West: And thus (saith * *Plutarch*) are we

De Celo,
lib. 2. c. 2.

* *De plac.*
cir. Philis.
lib. 2. c. 10.

E

to

† Lib 3.

to understand these expressions in *Pythagoras*, *Plato*, *Aristotle*. The Poets count the South to be towards the left, and the North the right hand. Thus † *Lucan*, speaking of the *Arabians* coming unto *Theſſaly*, ſays :

*Ignotum vobis Arabes veniſtis in orbem:
Umbras mirari nemorum, non ire ſiniſtras.*

The *Augures* taking their Observations at the Eaſt, count the South to be at their right hand, and the North their left : So that theſe Denominations have not any real ground in the nature of the things, but are impoſed upon them by the Scripture phraſe, in reference to the account and opinion of the *Jews*.

D Hakwel Thus alſo, becauſe heretofore it was generally received, that the Heart was the principal Seat of the Faculties; therefore doth the Spirit apply himſelf unto this common Tenent; and in many places, attributes Wiſdom and Underſtanding to the Heart. Whereas, to ſpeak properly, the reaſon and diſcuſſive Faculties have their principal reſidence in the Head (ſaith *Galen* and *Hippocrates*, together with the generality of our later Phyſicians) becauſe they are hindered in their Operations by the diſtempers of that part, and recovered by Medicines applied unto it.

So likewiſe are we to underſtand thoſe other places; *Iſa.* 59. 5. where ſome Tranſlations read it, *Ova Aſpidum ruperunt*, they have

have broken the *Vipers Eggs*; alluding to that common but fabulous ſtory of the *Viper*, who breaks his paſſage through the Bowels of the Female. So *Pſal.* 58. 4, 5. where the Prophet ſpeaks of the deaf *Adder*, that ſtops her Ears againſt the Voice of the *Charmer*. Both which relations (if we may believe many Naturaliſts) are as falſe as they are common : and yet, becauſe they were entertained with the general opinion of thoſe days, therefore doth the Holy Ghoſt vouchſafe to allude unto them in Holy Writ: 'Tis a plain miſtake of *Fromondus*, when in answer to theſe places, he is ſain to ſay, that they are uſed proverbially only, and do not poſitively conclude any thing. For when *David* writes theſe words, that they are like the deaf *Adder*; which ſtoppeth her Ears, &c. This affirmation is manifeſtly implied; That the deaf *Adder* does ſtop her Ears againſt the Voice of the *Charmer*; which becauſe it is not true in the Letter of it, (as was ſaid before) therefore 'tis very probable, that it ſhould be interpreted in the ſame ſenſe wherein here it is cited.

In reference to this alſo, we are to conceive of thoſe other expreſſions; *Cold cometh out of the North*, *Job* 37. 9. And again; *Fair Weather comes out of the North*, ver. 22. So ver. 17. *Thy Garments are warm, when he quieteth the Earth by the South Wind*. And; *Prov.* 25. 23. *The North Wind driveth away Rain*. Which Phraſes do not contain in them any abſolute general Truth; but can

*Veſta.
Tr. ſt 3.
cap. 3.*

Joel 2. 31.
Item c. 3.
15.

so far only be verified, as they are referred to several Climats : and though unto us who live on this side of the Line, the North Wind being coldest and driest ; and on the the contrary, the South Wind moist and Warm, by reason that in one of these places, there is a stronger heat of the Sun to exhale moist Vapours, than in the other : yet it is clean otherwise with the Inhabitants beyond the other Tropick ; for there the North Wind is the hottest, and moist ; and the South the coldest and dry : So that with them, these Scriptures cannot properly be affirmed, that *Cold, or that fair Weather cometh out of the North* ; but rather on the contrary : All which notwithstanding, does not in the least manner derogate from the truth of these Speeches, or the omniscience of the Speaker ; but do rather shew the Wisdom and Goodness of the blessed Spirit, in vouchsafing thus to conform his Language unto the capacity of those People unto whom these Speeches were first directed. In the same sense are we to understand all those places where the *Lights of Heaven* are said to be darkened, and the *Constellations* not to give their Light, Isa. 13. 10. Not as if they were absolutely in themselves deprived of their Light, and did not shine at all ; but because of their appearance to us : and therefore, in another place answerable to these, God says, *he will cover the Heavens*, and so make the Stars thereof dark, Ezek. 37. 2. Which argues, that they themselves were not deprived

prived of this Light (as those other Speeches seem to imply) but we.

In reference to this, likewise are we to conceive of those other expressions, that the *Moon shall blush, and the Sun be ashamed*, Isa. 24. 23. That they shall be turned into Blood, Matth. 24. 29. Not that these things shall be so in themselves, (saith S. Jerome) ^{Comment.} but because they shall appear so unto us. ^{in Joel 3.} Thus also, Mark 13. 25. *The Stars shall fall from Heaven* ; that is, they shall be so wholly covered from our sight, as if they were quite fallen from their wonted places. Or if this be understood of their real Fall, as it may seem probable by that place in Rev. 6. 13. *And the Stars of Heaven fell unto the Earth, even as a Fig-tree casteth her untimely Figs, when she is shaken by a mighty Wind* : then it is to be interpreted, not of them that are truly Stars, but them that appear so : alluding unto the opinion of the unskilful Vulgar, (saith * Sanctius) that ^{* Comment.} think the Meteors to be Stars. And † Mer- ^{in Isa. 13. 5} senius, speaking of the same Scripture, says, ^{† Comment.} *Hoc de veris Stellis minime volunt interpretes intelligi, sed de Comets & aliis ignitis Meteoris* : Interpreters do by no means understand this of true Stars, but of the Comets, and other fiery Meteors. Though the falling of these be a natural event, yet may it be accounted a strange Prodigy, as well as an Earthquake, and the darkning of the Sun and Moon, which are mentioned in the verse before.

In reference to this, doth the Scripture speak of some common natural effects, as if their true causes were altogether inscrutable, and not to be found out, because they were generally so esteemed by the Vulgar.

- * Joh. 3. 8. Thus of the Wind it is * said, *That none know whence it cometh, nor whither it goeth.*
- † Jer. 10. 13. In another † place, God is said to bring it out of his Treasures : And (a) elsewhere it is called the (b) Breath of God. And so likewise of the Thunder ; concerning which (b) מִפֶּה (c) Job proposes this question, *The Thunder of his Power who can understand ?* And therefore too (d) David does so often stile it, *the Voice of God.* All which places seem to imply, that the cause of these things was not to be discovered, which yet later Philosophers pretend to know : So that according to their construction, these phrases are to be understood, in relation unto their ignorance unto whom these Speeches were immediately directed.

For this reason is it : Why, tho there be in nature many other causes of Springs and Rivers than the Sea, yet Solomon (who was a great Philosopher, and perhaps not ignorant of them) does mention only this, because most obvious, and easily apprehended by the Vulgar. Unto all these Scriptures, I might add that in Amos 5. 8. which speaks of the Constellation, commonly called the *Seven Stars* ; whereas, later discoveries have found that there are but six of them discernable to the bare eye, as appears by

Gallilæus

Gallilæus his Glafs ; the seventh of them being but a deceit of the eye, arising from their too great nearness ; and if a Man try, in a clear Night, to number them distinctly, he shall find that there will sometimes appear but six, and sometimes more.

Vide Fromond.
Mise l. 3.
c. 1. art. 1.

True indeed, the original word of this Scripture, בִּימָר, does not necessarily imply any such number in its signification, but yet our English Translation renders it the *seven Stars* ; and if it had been expressly so in the Original too, it might have spoken true enough, because they are usually esteemed of that number. And when it had been said, *He made the seven Stars, and Orion*, we might easily have understood the words thus : He made those Constellations that are commonly known unto us under such names.

From all these Scriptures, 'tis clearly manifest, that it is a frequent custom for the Holy Ghost to speak of natural Things, rather according to their appearance and common opinion, than the truth it self. Now it is very plain, and our Enemies themselves do grant it, that if the World had been framed according to the Systeme of Copernicus, *Futurum esset ut vulgus, de Solis motu & Terre statu proinde ut nunc loqueretur.* The vulgar phrase would have been the same as now it is, when it speaks of the Sun's Motion, and the Earth's standing still.

Wherefore 'tis not improbable, that such kind of Scripture-expressions, are to be un-

E 4 derstood

derstood only in relation to outward appearances, and vulgar opinion.

PROP. IV.

That divers learned Men have fallen into great Absurdities, whilst they have looked for the Grounds of Philosophy from the words of Scripture.

Schickard.
Bechin.
Hapern.
Disp. 5.
num. 8.

IT has been an ancient and common opinion amongst the Jews, that the Law of Moses did contain in it, not only those things which concern our Religion and Obedience, but every Secret also that may possibly be known in any Art or Science; so that there is not a Demonstration in Geometry, or Rule in Arithmetick; not a Mystery in any Trade, but it may be found out in the Pentateuch. Hence it was (say they) that Solomon had all his Wisdom and Policy: Hence it was that he did fetch his Knowledge concerning the nature of Vegetables, from the Cedar of Lebanon to the Hyssop that grows upon the Wall. Nay, from hence, they thought a Man might learn the Art of Miracles, to remove a Mountain, or recover the dead. So strangely have the learned sort of that Nation been befooled, since their own Curse hath lighted upon them.

Not

Not much unlike this foolish superstition of theirs, is that custom of many Artists amongst us; who upon the invention of any new Secret, will presently find out some obscure Text or other to Father it upon; as if the Holy Ghost must needs take notice of every particular, which their partial Fancies did over-value.

Nor are they altogether guiltless of this Fault, who look for any Secrets of Nature from the words of Scripture; or will examine all its expressions by the exact Rules of Philosophy.

Unto what strange Absurdities this false Imagination of the learned Jew hath exposed them, may be manifest by a great multitude of Examples. I will mention only some few of them. Hence it is, that they prove the shin-bone of Og the Giant to be above three leagues long: Or (which is a more modest relation) that Moses being fourteen Cubits in stature, having a Spear ten ells in length, and leaping up ten Cubits, could touch this Giant but on the Ankle. All which, they can confirm unto you by a cabalistical interpretation of this story, as it is set down in Scripture. Hence it is, that they tell us of all those strange Beasts which shall be seen at the coming of the Messiah: as first, the Ox, which Job calls Behemoth, that every day devours the Grass on a thousand Mountains; as you may see it in the * Psalm, where David mentions the Cattel, or כהררי אל upon a thousand Hills. If you

Schickard.
ib. Disp. 6.
num. 3.

Buxtor.
Synag.
Juda. 2. 36.
* Ps. 50. 10.

ask

ask how this Beast does to find Pasture enough? they answer, that he remains constantly in one place, where there is as much Grass grows up in the Night, as was eaten in the Day.

They tell us also of a Bird, which was of that quantity, that having upon a time cast an Egg out of her Nest, there were beaten down by the fall of it, three hundred of the tallest Cedars, and no less than threescore Villages drowned. As also of a Frog, as big as a Town capable of sixty Houses; which Frog, notwithstanding his greatness, was devoured by a Serpent, and that Serpent by a Crow; which Crow, as she was flying up to a Tree, eclipsed the Sun, and darkned the World; by which you may guess, what a pretty Twig that Tree was. If you would know the proper Name of this Bird, you may find it in *Psal.* 50. 11. where it is called *Y. Parap.* *Chald.* or in our Translation, the Fowl of the Mountains. It seems it was somewhat of kin to that other Bird they tell us of, whose Legs were so long, that they reached unto the bottom of that Sea, where there had been an Ax-head falling for seven Years together, before it could come to the bottom.

Many other Relations there are, which contain such horrible Absurdities, that a Man cannot well conceive how they should proceed from reasonable Creatures. And all this arising from that wrong Principle of theirs; That Scripture did exactly contain
in

in it all kind of Truths; and that every meaning was true, which by the Letter of it, or by Cabalistical Interpretations, might be found out.

Now as it hath been with them, so likewise hath it hapned in proportion unto others; who by a superstitious adhering unto the bare words of Scripture, have exposed themselves unto many strange Errors. Thus * *S. Basil* holds, That next to the Sun, * *Enarrat.* the Moon is bigger than any of the Stars, *in Gen.* because *Moses* does call them only two great Lights.

Thus others maintain, That there are Waters, properly so called, above the starry Firmament, because of those vulgar expressions in Scripture, which in their literal sense do mention them. Of this opinion were many of the Ancients, *Philo*, *Josephus*; and since them the Fathers, (a) *Justin Martyr*, (b) *Theodoret*, (c) *Austin*, (d) *Ambrose*, (e) *Basil*, and almost all the rest. Since them, sundry other learned Men, as *Bede*, *Strabo*, *Damascen*, *Tho. Aquinas*, &c. If you ask for what purpose they were placed here? *Justin Martyr* tells us, for these two ends: First, To cool the heat that might otherwise arise from the motion of the solid Orbs; and hence it is (say they) that *Saturn* is colder than any of the other Planets, because tho he move faster, yet he is nearer to these Waters. Secondly, To press and keep down the Heavens, lest the frequency and violence of Winds, might break and scatter

(a) *Resp.*

(d) *Hex-*
am. l. 2. c. 2
(e) *Homil.*
3. *in Gen.*

scatter them afunder; which Opinion, together with both its Reasons, are now accounted absurd and ridiculous.

* *De Civit. Du.*, l. 16. S. * *Austin* concludes the visible Stars to be innumerable, because Scripture-phrases seem to imply as much.

That the Heavens are not round, was the opinion of (a) *Justin Martyr*, (b) *Ambrose*, (c) *Chrysostom*, (d) *Theodoret*, (e) *Theophilact*; doubted of by (f) *S. Austin*, and divers others. Nay, *S. Chrysostom* was so confident of it, that he proposes the question in a triumphant manner: Πῶς εἰσὶν οἱ σφαίριοι ἐδὲν ἑαυτὸν εἰπεῖν ἀποφανόμενοι. Where are those Men that can prove the Heavens to have a sphaerical Form? The reason of which was this, Because 'tis said in one Scripture, that God stretched forth the Heavens as a Curtain, Psal. 104. 2. and spreadeth them as a Tent to dwell in, Isa. 40. 22. And so in *Heb.* 8. 2. they are called a Tent or Tabernacle: which because it is not sphaerical, therefore they conclude also, that the Heavens are not of that form; whereas now, the contrary is as evident as Demonstration can make a thing. And therefore, * *S. Jerome* in his time, speaking of the same Error, gives it this plain censure; *Est in Ecclesia stultiloquium, si quis Cælum putet fornicis modo curvatum, Esaia quem non intelligit sermone deceptus*: 'Tis foolish speaking in the Church, if any, through misapprehension of those words in *Isaiah*, shall affirm the Heavens not to be round.

* *Lib. 3. Comment. in Gal. 5.*

That

That the Seas not overflowing the Land, is a Miracle, was the opinion of (a) *Basil*, (b) *Chrysostom*, (c) *Theodoret*, (d) *Ambrose*, (e) *Nazianzen*; and since them, (f) *Aquinas*, (g) *Luther*, *Calvin*, *Marlorat*; with fundry others. Which they proved from these Scripture-expressions; that in *Job* 38. 8, 11. Who hath shut up the Sea with doors, when it brake forth, as if it had issued out of the Womb; when I did break up for it my decreed place; and set bars and doors, and said, hitherto shalt thou come, and no further, and here shall the pride of thy Waves be staid. So likewise, *Prov.* 8. 29. God gave to the Sea his Decree, that the Waters should not pass his Commandment. And *Jer.* 5. 22. I have placed the Sand for a bound of the Sea, by a perpetual Decree, that they cannot pass it: and tho the Waves thereof toss themselves, yet can they not prevail; tho they roar, yet can they not pass over, that they turn not again to cover the Earth. In all which places (say they) 'tis implied, that the Water of it self, were it not withheld from its own natural inclination, by a more special Power of God, would overflow the Land.

Others infer the same conclusion from that in *Ecclesiastes*, where the Rivers are said to come from the Sea; which they could not do, unless that were higher. I answer; They should as well consider the latter part of that Scripture, which says, that the Rivers return to that place from whence they came, and then the force of this consequence will vanish.

Luk. 5:24.
Eisw Ca-
60.

vanish. To this purpose, some urge that speech of our Saviour, where he bids *Simon* to launch forth into the deep; the Latin word is, *in altum*; from whence they gather, that the Sea is higher than the Land. But this favours so much of Monkish Ignorance, that it deserves rather to be laughed at, than to be answered.

But now if we consider the true Properties of this Element, according to the Rules of Philosophy; we shall find, that its not overflowing the Land, is so far from being a Miracle, that it is a necessary consequence of its Nature; and 'twould rather be a Miracle, if it should be otherwise, as it was in the general Deluge. The reason is, because the Water of it self must necessarily descend to the lowest place; which it cannot do, unless it be collected in a spherical Form, as you may plainly discern in this Figure.

Where the Sea at D may seem to be higher than a Mountain at B, or C, because the rising

rising of it in the midst, does so intercept our sight from either of those places, that we cannot look in a streight Line from the one to the other. So that it may seem to be no less than a Miracle, by which the Sea (being a heavy Body) was with-held from flowing down to those lower places of B, or C. But now, if you consider that the ascending of a Body, is its motion from the Centre; and descent, is its approaching unto it: you shall find, that the Sea to move from D, to B or C, is a motion of Ascent, which is contrary to its nature, because the Mountain at B, or C, are farther off from the Centre, than the Sea at D, the Lines A B, and A C, being longer than the other A D. So that for the Sea to keep always in its Channel, is but agreeable to its Nature, as being a heavy Body. But the meaning of those Scriptures, is, to set forth the Power and Wisdom of God; who hath appointed these Channels for it, and beset it with such strong Banks, to withstand the fury of its waves. Or if these Men do so much rely in natural Points, upon the bare words of Scripture, they might easily be confuted from those other places, where God is said to have founded the Earth upon the Seas, and established it upon the Floods. From the literal interpretation of which, many of the Ancients have fallen into another Error; affirming, the Water to be in the lower place; and as a *basis*, whereon the the weight of the Earth was born up. Of this

a) *Recog.*⁸ this opinion were (a) *Clement Alexandrinus*,
 b) *Orar.* (b) *Athanasius*, (c) *Hilary*, (d) *Ensebius*,
cont. Ido- and others. So that it seems, if a Man
los. c) *In Psal.* should resolutely adhere to the bare words
136. 6. of the Scripture, he might find contradic-
 d) *In Ps.* tion in it: of which, the natural meaning
24. is altogether incapable. * *S. Jerome* tells us
in Isa. l. 13 of some who would prove Stars to have
 understanding, from that place in *Isa. 45.*
12. My hands have stretched out the Heavens,
and all their Host have I commanded. Now
 (say they) none but intelligent Creatures are
 capable of Precepts; and therefore, the
 Stars must needs have rational Souls. Of
 this opinion was * *Philo the Jew*: nay, ma-
 ny of the Rabbies conclude, that they do
 every hour sing praises unto God, with an
 audible real Voice. But of that in *Job 38.*
7. which speaks of the Morning Stars sing-
ing together. And *Psal. 19. 3, 4.* where 'tis
 said of the Heavens, that *there is no speech*
nor language where their Voice is not heard, and
their words are gone to the ends of the World.
 And whereas we translate that place in the
 tenth of *Joshua*, concerning the standing still
 of the Heavens; the original word, *רום*,
 does properly signify *Silence*; and according
 to their opinion, *Joshua* did only bid them
 hold their peace. From such grounds, 'tis
 likely did * *Origen* fetch his Opinion, that
 the Stars should be saved. I might set down
 many other the like Instances, were it not
 for being already weary of raking into the
 Errors of Antiquity; or uncovering the
 naked-

* *De plant.*
Noe.
Tostatus
in Josh.
c. 10 quest.
13, 14.

* *Tom. I.*
in Johan.

nakedness of our Forefathers. That ex-
 cuse of * *Acosta*, may justly serve to miti-
 gate the Mistakes of these Ancient Divines:
Facile condonandum est patribus, si cum cognos-
tendo colendoque Creatori toti vacarent, de
creatura minus apte aliqua ex parte opinati
sum. Those good Men were so wholly bu-
 sied about the Knowledg and Worship of the
 Creator, that they had not leisure enough
 for an exact search into the Essence of the
 Creatures. However, these Examples that
 have been already cited, may sufficiently
 manifest, how frequently others have been
 deceived, in concluding the Points of Phi-
 losophy from the Expressions of Scrip-
 ture. And therefore, 'tis not certain, but
 that in the present case also, it may be
 insufficient for such a manner of argu-
 ing.

* *De nat.*
novi orbis
lib. I c. 2.

F

PROP:

PROP. V.

That the Scripture, in its proper construction, does not any where affirm the Immobility of the Earth.

THE same Answer which was insisted on before, concerning the conformity of Scripture-expressions, to Mens capacity and common opinion, may well enough satisfy all those Arguments, which seem thence to affirm the Earth's settledness and immobility; since this is as well agreeable to outward appearance, and vulgar apprehension, as the other.

But now, for more full satisfaction, I shall set down the particular places that are urged for it; which being thoroughly examined, we may plainly discern, that none of them, in their proper meaning, will serve to infer any such conclusion.

One of these sayings, is that of the Preacher, *Eccles. 1. 4. One Generation cometh, and another passeth, but the Earth endureth for ever*; where the original word is, עמרת, and the vulgar, *stat*; from whence our * Adversaries conclude, that it is immoveable.

I answer: The meaning of the word, as it is here applied, is *permanet*; or as we translate

* Vallesius

in Lucan.

translate it, *endureth*. For it is not the purpose of this place, to deny all kind of motion to the whole Earth: but that of Generation and Corruption, to which other things in it are liable, And though Pineda, and others, keep a great deal of impertinent stir about this Scripture, yet they grant this to be the natural meaning of it; which you may more clearly discern, if you consider the chief scope of this Book; wherein the Preacher's intent is, to shew the extraordinary vanity of all earthly Contentments, *ver. 2.* the utter unprofitableness of all a Man's Labours, *ver. 3.* And this he illustrates, by the shortness and uncertainty of his Life; in which respect, he is below many of his fellow Creatures, as may be manifested from these four Comparisons.

1. From the Earth, which tho it seem to be but as the Sediment of the World, as the Rubbish of the Creation; yet is this better than Man in respect of his lastingness, for *one Generation passeth away, and another cometh; but the Earth, that abideth for ever*; *ver. 4.*

2. From the Sun; who, though he seem frequently to go down, yet he constantly seems to rise again, and shines with the same glory, *ver. 5. But Man dieth and wasteth away; yea, Man giveth up the Ghost; and where is he? He lieth down, and riseth not, till the Heavens be no more.* Job 14.
10, 12.

3. From the Wind, the common Emblem of Uncertainty; yet it is more constant

stant than Man, for that *knows its circuits,*
 Pf. 78. 39. *and whirleth about continually,* ver. 6. *whereas*
our life passeth away as doth the VVind, but re-
turneth not again.

4. From the Sea ; tho it be as uncertain
 as the Moon, by whom 'tis governed, yet is
 it more durable than Man and his Happi-
 ness. For tho the Rivers run into it, and
 from it, yet is it still of the same quantity
 that it was at the beginning, *vers. 7.* But
 Man grows worse, as he grows older, and
 still nearer to a decay. So that in this re-
 spect, he is much inferior to many other of
 his fellow Creatures.

From whence it is manifest ; that this con-
 stancy, or standing of the Earth, is not op-
 posed to its local motion, but to the chang-
 ing or passing away of divers Men in their
 severall Generations. And therefore, thence
 to conclude the Earth's Immobility, were as
 weak and ridiculous, as if one should argue
 thus : One Miller goes, and another comes,
 but the Mill remains still ; *ergo*, the Mill hath
 no motion.

M. Car-
 penter's
Geog. l. 1.
 c. 4.

Or thus ; one Pilat goes, and another
 comes, but the Ship remains still ; *ergo*, the
 Ship doth not stir.

* *Perplex.*
l. 2. c. 29.

* *R. Moses* tells us, how that many of the
 Jews did from this place conclude, that *Solomon*
 thought the Earth to be Eternal, be-
 cause he saith it abideth, לעיל, for ever ;
 and questionless, if we examine it impar-
 tially, we shall find that the phrase seems
 more to favour this Absurdity, than that
 which

which our Adversaries would collect from
 hence, that it is without motion.

But Mr. *Faller* urging this Text against *Co-*
pernicus, tells us ; If any should interpret
 these Phrases, concerning the Earth's stand-
 ing still, *vers. 4.* and the Sun's motion,
vers. 5. in reference only to appearance and
 common opinion, he must necessarily also
 understand those two other Verses, which
 mention the motion of the Wind and Ri-
 vers, in the same sense. As if he should say,
 because some things appear otherwise than
 they are, therefore every thing is otherwise
 than it appears : or, because Scripture speaks
 of some natural things, as they are esteemed
 according to Man's false conceit ; therefore
 'tis necessary, that every natural thing men-
 tioned in Scripture, must be interpreted in
 the like sense : or, because in one place we
 read of the ends of a Staff, *1 Kings 8. 8.*
 and in many other places, of the ends of
 the Earth, and the ends of Heaven : There-
 fore the Earth and Heavens have as properly
 ends, as a Staff. 'Tis the very same Conse-
 quence with that in the Objection. Because
 in this place of *Ecclesiastes*, we read of the
 rest of the Earth, and the motion of the
 Sun ; therefore, these Phrases must needs
 be understood in the same proper constru-
 ction as those afterwards, where Motion
 was attributed to the Wind and Rivers.
 Which Inference you see is so weak, that the
 Objector need not triumph so much in its
 strength as he doth.

Another proof like unto this, is taken from St. Peter, *Epist.* 2. *Cap.* 3. v. 5. where he speaks of the Earth standing out of the Water, and in the Water, *in submersa*; and therefore the Earth is immoveable.

I answer: 'Tis evident that the word here is equivalent with *suit*: and the scope of the Apostle is, to shew, that God made all the Earth; both that which was above the Water, and that which was under it. So that from this expression, to collect the rest and immobility of the Earth, would be such an Argument as this other. Such a Man made that part of a Mill-wheel; or a Ship, which stands below the Water, and that part which stands above the Water; therefore those things are immoveable.

To such vain and idle Consequences, does the heat of Opposition drive our Adversaries.

A third Argument, stronger than either of the former, they conceive may be collected from those * Scriptures: where 'tis said, *The World is established, that it cannot be moved.*

* 1 Chron.
16, 30.
Psal. 93. 1.
Item 96.
30.

To which, I answer: These places speak of the World in general, and not particularly of our Earth; and therefore may as well prove the immobility of the Heavens, they being the greatest part of the World; in comparison to which, our Earth is but as an insensible Point.

If you reply, that the word in these places is to be understood by a *Synecdoche*, as being

being meant only of this habitable World, the Earth.

I answer: First, This is only said, not proved. Secondly, *David*, but a little before, seems to make a difference between the World and the Earth, *Psal.* 90. 2. where he says, *Before thou hadst formed the Earth and the World.* But, thirdly, in another place, there is the same original word applied expressly to the Heavens; and which is yet more, the same place does likewise mention this supposed settledness of the Earth; *Prov.* 3. 19. *The Lord by Wisdom hath founded the Earth: and by Understanding, hath he established the Heavens.* So that these places can no more prove an immobility in the Earth than in the Heavens.

If you yet reply, That by the Heavens there, is meant the Seat of the Blessed, which does not move with the rest.

I answer: Tho by such an evasion, a Man might possibly avoid the force of this plate: yet, first, 'tis but a groundless shift: because then, that Verse will not contain a full enumeration of the parts in the World, as may seem more agreeable to the intention of it; but only shew, that God created this Earth where we live, and the Heaven of Heavens. So that the Heaven of the Stars and Planets, shall be shifted out from the number of the other Creatures. Secondly, There is another place which cannot be so avoided, *Psal.* 89. 37. where the Psalmist uses this expression, *יָבִין, It shall be established as the*

Moon. So Psalm. 8. 3. *The Moon and the Stars, אֲשֶׁר כִּנְנִיתָ, which [thou hast established.]* Thus likewise, Prov. 8. 27. *when he established the Heavens:* And in the next Verse, our English Translation reads it, *when he established the Clouds.* And yet our Adversaries will affirm the Moon, and Stars, and Clouds, to be subject unto natural Motions: Why then should the very same expressions be counted as sufficient Arguments to take it away from the Earth?

If it be replied; That by establishing the Heavens, is meant only the holding of them up, that they do not fall down to us, (as *Lorinus* explains that in Psalm. 8. and quotes *Euthymius* for the same interpretation) *Fundandi verbum significat decidere non posse, aut dimoveri a loco ubi collocata sunt.* I answer, Why may not we as well interpret the words this of the Earth; so that by establishing of it, is meant only the keeping of it up in the vast places of the open Air, without falling to any other place.

From hence it is plain, That these Scriptures are to be understood of such an immobility in the Earth, as may likewise agree with the Heavens: the same original word being so promiscuously applied to both.

I, but (you will say) there are some other places which do more peculiarly apply this settledness and establishment to the Earth. So Psalm. 119. 9. *Thy Faithfulness is unto all Generations: Thou hast established the Earth,*
and

and it abiderth. Thus likewise, Psalm. 104. 5. *Who laid the Foundations of the Earth, that it should not be removed for ever.* The latter of which, being well weighed in its Original, (saith Mr. Fuller) does in three emphatical words, strongly conclude the Earth's immobility.

Miscel l. 1.
c. 15.

As first, when he says, יסד *fundavit*, he hath founded it: wherein it is implied, that it does not change its place. To which may be added all those Texts, which so frequently speak of the Foundations of the Earth; as also that expression of the Psalmist, where he mentions the Pillars of the Earth, Psalm. 75. 3.

The second word is (מבונִיָּה) translated *Basis*; and by the Septuagint, ὅτι τὴν ἀσφάλειαν αὐτοῦ; that is, he hath founded it upon its own firmness; and therefore it is altogether without motion.

The third expression is בל-תמוט, from the Root, מוט, which signifies *declinare*; implying, that it could not wag with the least kind of declination.

To these I answer severally:

First, For the word, יסד *fundavit*, It cannot be understood properly, as if the natural Frame of the Earth, like other artificial Buildings, did need any bottom to uphold it; for he *hangeeth the Earth upon nothing*, Job 26. 7. But it is a *Metaphor*, and signifies God's placing or scituating this Globe of Land and Water. As David tells us of the Pillars of the Earth: so Job mentions

tions *Pillars of the Heavens*, Job 26. 11. and yet that will not prove them to be immovable.

True indeed, we read often concerning the Foundations of the Earth: but so we do likewise of the Ends, Sides, and Corners of the Earth; and yet these Scriptures will not prove it to be of a long or square form. Besides, we read also of the Foundations of Heaven, מוֹסְדוֹת הַשָּׁמַיִם, 2 Sam. 22. 8. And yet we must not hence infer, that they are without all motion; As also of the *planting of the Heavens*, Isa. 51. 6. which may as well prove them to be immovable, as that which follows in the same Verse concerning the Foundations of the Earth.

Which phrase (if I have observed right) in several places of Scripture, is to be understood, according to these three Interpretations.

1. It is taken sometimes for the lower parts of the Earth, as appears by that place 2 Sam. 22. 16. *The Channels of the Sea appeared; the Foundations of the World were discovered.*

2. Sometimes for the beginning and first creation of it, Isa. 40. 21. *Hath it not been told you from the beginning? have ye not understood from the Foundations of the Earth?* And in many other places, *Before the Foundation of the World was laid*; that is, before the first Creation.

Sometimes it signifies the Magistrates and chief Governors of the Earth. So many in-

So Psal.
18. 15.

Joh. 17. 24
Ephes. 1. 4.

interpret that place in *Micah* 6. 2. where 'tis said, *Hear, O ye Mountains, the Lord's Controversy, and ye strong Foundations of the Earth.* So *Psal.* 82. 5. *The Foundations of the Earth are out of course:* And in 1 *Sam.* 2. 8. they are called Pillars; *For the Pillars of the Earth are the Lords, and he hath set the World upon them.* Hence it is, that the Hebrews derive their word for Master, or Lord; from a Root which signifies a *Basis*, or Bottom, אָרֶן *ab* אָרֶן. And the Greek word *Erymol. mag.* for King, does, in its Primitives, import as much as the Foundation of the People, βασιλεύς, *quasi* βάσις τῆς λαοῦ. But now, none of all the several interpretations of this phrase, will in the least manner conduce to the confirmation of the present Argument.

As for the second word, מְבִינִיךָ, *Basis ejus*. I answer, The proper signification of it, is, *locus dispositus, sedes, or statio*, an appointed Seat or Station; and according to this sense, is it most frequently used in Scripture. And therefore, the Heavens are sometimes called, מְבִין, the Seat of God's Habitation. And for this reason likewise, do *Aquila* and *Symmachus* translate it by the word ἐσῆα, a Seat, or appointed situation, which may as well be attributed to the Heavens.

The third expression is בִּלְתִּמּוֹט, that it should not be moved from the Primitive מוֹט which does not signify barely to move, but

but *declinare*, or *vacillare*, to decline or slip aside from its natural course. Thus it is used by *David*, Psal. 17. 5. where he prays, *Hold up my goings in thy Paths*, כַּדְּמִינִי בְּדַמִּינֶיךָ, *that my Foot-steps slide not*. He does not mean that his feet should not move. So Psal. 121. 3. *He will not suffer thy foot to be moved*. Thus likewise, Psal. 16. 8. *Because the Lord is at my right hand, I shall not be moved*: which last place is translated in the

Act. 2. 25. New Testament, by the Greek word *εὐλαβω*, which signifies *fluctuate*, or *vacillare*, to be shaken by such an uncertain motion, as the Waves of the Sea. Now, as *David's* feet may have their usual motion, and yet in this sense be said not to move, that is, not to decline or slip aside: so neither can the same phrase, applied to the Earth, prove it to be immovable.

Nor do I see any reason, why that of *Comment. in Job.* *Didacus Astunica*, may not be truly affirmed, That we may prove the natural motion of the Earth, from that place in Job 6. 9. *Qui commouet terram à loco suo*, as well as its rest and immobility from these.

From all which, it is very evident, that each of these expressions, concerning the founding or establishing both of Heaven or Earth, were not intended to shew the unmovableness of either, but rather, to manifest the Power and Wisdom of Providence, who had so settled these parts of the World

World in their proper situations, that no natural cause could displace them, or make them decline from their appointed course. As for such who do utterly dislike all new interpretation of Scripture, even in such matters as do meerly concern Opinion, and are not fundamental: I would only propose unto them a speech of *S. Hierome*, concerning some that were of the same mind in his time; *Cum novas semper expetant voluptates, & gula eorum vicina Maria non sufficiant, cur in solo studio Scripturarum, veteri sapore contenti sunt?*

Thus have I in some measure cleared the chief Arguments from Scripture, against this Opinion. For which notwithstanding, I have not thence cited any; because I conceive the Holy Writ, being chiefly intended to inform us of such things as concern our Faith and Obedience: we cannot thence take any proper proof for the confirmation of Natural Secrets.

PROP.

P R O P. VI.

That there is not any Argument from the Words of Scripture, Principles of Nature, or Observations in Astronomy, which can sufficiently evidence the Earth to be in the Centre of the Universe.

Our Adversaries do much insult in the strength of those Arguments which they conceive, do unanswerably conclude, the Earth to be in the Centre of the World. Whereas, if they were but impartially considered, they would be found altogether insufficient for any such conclusion, as shall be clearly manifested in this following Chapter.

The Arguments which they urge in the proof of this, are of three sorts; Either such as are taken,

1. From expressions of Scripture.
2. From Principles of Natural Philosophy.
3. From common appearances in Astronomy.

Those of the first kind, are chiefly two: The first is grounded on that common Scripture-phrase, which speaks of the Sun as being above us. So Solomon often mentioning humane

humane Affairs; calls them, *the Works* Ecclesi. 1. which are done under the Sun. From whence it appears, that the Earth is below it; and therefore nearer to the Centre of the Universe than the Sun. 14. &c.

I answer: Though the Sun, in comparison to the absolute Frame of the World, be in the midst; yet this does not hinder, but that in respect to our Earth, he may be truly said to be above it, because we usually measure the height or lowness of any thing, by its being further off, or nearer unto this Centre of our Earth. From which, since the Sun is so remote, it may properly be affirmed, that we are under it; though notwithstanding that be in the Centre of the World.

A second Argument of the same kind, is urged by *Fromondus*.

'Tis requisite, that Hell (which is in the Centre of the Earth) should be most remotely situated from the Seat of the Blessed. But now this Heaven, which is the Seat of the Blessed, is concentrical to the starry Sphere. And therefore it will follow, that our Earth must be in the midst of this Sphere; and so consequently in the Centre of the World. Antar. c. 11. item Vest. tract. 5. c. 2.

I answer: This Argument is grounded upon these uncertainties;

1. That Hell must needs be situated in the Centre of our Earth.
2. That the Heaven of the Blessed, must needs be concentrical to that of the Stars.

3. That

3. That places must be as far distant in situation, as in use :

Which because they are taken for granted, without any proof, and are in themselves but weak and doubtful : therefore the conclusion (which always follows the worse part) cannot be strong, and so will not need any other answer.

The second sort of Arguments taken from natural Philosophy, are principally these three :

Arg. 1. From the vileness of our Earth, because it consists of a more sordid and base Matter than any other part of the World ; and therefore, must be situated in the Centre, which is the worst place, and at the greatest distance from those purer incorruptible Bodies, the Heavens.

I answer : This Argument does suppose such Propositions for Grounds, which are not yet proved ; and therefore not to be granted. As,

1. That Bodies must be as far distant in Place, as in Nobility.

2. That the Earth is a more ignoble Substance than any of the other Planets, consisting of a more base and vile Matter.

3. That the Centre is the worst place.

All which, are, if not evidently false, yet very uncertain.

Arg. 2. From the nature of the Centre, which is the place of Rest, and such as in all circular Motions, is it self immovable ; And therefore will be the fittest situation for

for the Earth ; which by reason of its heaviness, is naturally unfit for motion.

I answer : This Argument likewise is grounded upon these two false Foundations : As,

1. That the whole Frame of Nature does move round, excepting only the Earth.

2. That the whole Earth, considered as whole, and in its proper place, is heavy, or more unfit for a natural motion than any of the other Planets.

Which are so far from being such general Grounds, from which Controversies should be discussed, That they are the very thing in question betwixt us and our Adversaries.

Arg. 3. From the nature of all heavy Bodies, which are to fall towards the lowest place. From whence they conclude, that our Earth must be in the Centre.

I answer : This may prove it to be a Centre of Gravity, but not of Distance ; or that it is in the midst of the World. Yea, (but says our Adversaries) *Aristotle* for this urges a Demonstration, which must needs be infallible. Thus, the motion of light Bodies, does apparently tend upward towards the Circumference of the World ; but now the motion of heavy Bodies, is directly contrary to the ascent of the other ; wherefore it will necessarily follow, that these do all of them tend unto the Centre of the World.

I answer: Though *Aristotle* were a Master in the Art of *Syllogisms*, and he from whom he received the Rules of Disputation; yet in this particular, 'tis very plain that he was deceived with a Fallacy, whilst his Argument does but only suppose that which it pretend to prove.

That light Bodies do ascend unto some Circumference which is higher and above the Earth, is plain and undeniable. But that this Circumference is the same with that of the World, or concentric unto it, cannot be reasonably affirmed, unless he supposes the Earth to be in the Centre of the *Universe*, which is the thing to be proved.

I would fain know from what grounds our Adversaries can prove, that the descent of heavy Bodies is to the Centre; or the ascent of light Bodies, to the Circumference of the World. The utmost experience we can have in this kind, does but extend to those things that are upon our Earth, or in the Air above it. And alas, what is this unto the vast frame of the whole *Universe*, but *punctulum*, such an insensible Point, which does not bear so great a proportion to the whole, as a small Sand does unto the Earth? Wherefore it were a senseless thing, from our experience of so little a part, to pronounce any thing infallibly concerning the situation of the whole.

The

The Arguments from *astronomy*, are chiefly these four; each of which are boasted of to be unanswerable.

Arg. 1. The *Meridian* does every where divide all the great Circles of a Sphere into two equal parts: So there is always half the *Equinoctial* above it, and half below! This likewise, there will constantly be six Signs of the *Zodiac* above the *Meridian*, and other six below it. And besides, the Circles of the *Heaven* and Earth, are each way proportionable to one another; as fifteen German miles on the Earth, are every where agreeable to one Degree in the Heavens; and one Hour in the Earth, is correspondent to fifteen Degrees in the *Equator*: From whence it may be inferred, that the Earth must necessarily be situated in the midst of these Circles; and so consequently, in the Centre of the World.

I answer: This Argument does rightly prove the Earth to be in the midst of these Circles: But we cannot hence conclude, that it is in the Centre of the World: from which, tho' it were never so much distant, yet would it still remain in the midst of those Circles, because it is the Eye that imagines them to be described about it. Wherefore it were a weak and preposterous Collection, to argue thus, That the Earth is in the Centre of the World, because in the midst of those Circles; or because the Parts and Degrees of the Earth, are answerable in proportion to the Parts and Degrees in Heaven. Whereas;

G 2

it

it follows rather on the contrary, That these Circles are equally distant and proportional in their parts, in respect of the Earth, because it is our Eye that describes them about the Centre of it.

So that though a far greater part of the World did appear at one time than at another; yet in respect of those Circles which our Eye describes about the Earth, all that we could see at once, would seem to be but a perfect Hemisphere: As may be manifested by this following Figure.

Where if we suppose A to be our Earth, BCDE one of the great Circles which

we

we fancy about it, F G H I the Orb of fixed Stars, R the Centre of them. Now though the Arch, G F I, be bigger than the other, G H I, yet notwithstanding, to the Eye on the Earth A, one will appear a Semicircle as well as the other; because the Imagination does transfer all those Stars into the lesser Circle, B C D E, which it does fancy to be described above that Centre. Nay, though there were a habitable Earth, at a far greater distance from the Centre of the World, even in the place of *Jupiter*; as suppose at Q, yet then also would there be the same appearance. For though the Arch, K F L, in the starry Heaven, were twice as big as the other, K H L, yet notwithstanding, at the Earth Q, they would both appear but as equal Hemispheres, being transferred into that other Circle, M N O P, which is part of the Sphere that the Eye describes to it self about the Earth.

From whence we may plainly discern, That though the Earth be never so far distant from the Centre of the World; yet the Parts and Degrees of that imaginary Sphere about it, will always be proportional to the Parts and Degrees of the Earth.

Arg. 2. Another Demonstration like unto this former, frequently urged to the same purpose, is this: If the Earth be out of the Centre of the World, then must it be situated in one of these three Positions: *either in the Equator, but out of the Axis;*

Vid. Corp. Geog. l. 2. c. 5.

G 3

or,

or, secondly, in the *Ax*, but out of the *Equator*; or, thirdly, besides both of them. But it is not placed according to any of these scituations; therefore must it needs be in the Centre.

1. *It is not in the Equator*; and beside the *Ax*. For then, first, there will be no *Equinox* at all in some places, when the Days and Nights shall be of unequal length. Secondly, The *Auricula* and *Forenoon* will not be of the same length; because, then our Meridian Line must divide the Hemisphere into unequal parts.

2. *It is not in the Equator*, but out of the *Equator*. For then, first, the *Equinox* would not happen when the Sun was in the middle Line between the two *Solstices*, but in some other Parallel, which might be nearer to one of them, according as the Earth did approach to one *Tropic* more than another. Secondly, There would not be such a proportion between the increase and decrease of Days and Nights, as now there is.

3. *It is not besides both of them*. For then, all these Inconveniences, and sundry others, must with the same necessity of consequence be inferred. From whence it will follow, That the Earth must be scituated there, where the *Ax* and *Equator* meet, which is in the Centre of the World.

To this we grant, that the Earth must needs be placed, both in the *Ax* and *Equator*; and so consequently, in the Centre of that Sphere which we imagine about it:

But

But yet this will not prove, that it is in the midst of the *Universe*. For let our Adversaries suppose it to be as far distant from that, as they conceive the Sun to be; yet may it still be scituated, in the very concourse of these two Lines: because the *Ax* of the World is nothing else but that imaginary Line which passes through the Poles of our Earth, to the Poles of the World. And so likewise the *Equator*, is nothing else but a great Circle in the midst of the Earth, betwixt both the Poles, which by imagination is continued even to the fixed Stars. Thus also, we may affirm the Earth to be in the plane of the *Zodiack*, if by its annual motion it did describe that imaginary Circle: and in the plane of the *Equator*, if by its diurnal motion about its own *Ax*, it did make several Parallels, the midst of which should be the *Equator*. From whence it appears, that these two former Arguments proceed from one and the same mistake, whilst our Adversaries suppose the Circumference and Center of the Sphere, to be the same with that of the World.

Another demonstration of the same kind, *Arg. 3.* is taken from the Eclipses of the Sun and Moon; which would not always happen when these two Luminaries are diametrically opposed, but sometimes when they are less distant than a Semicircle, if it were so that the Earth were not in the Centre.

I answer: This Argument, if well considered, will be found most directly to infer

this conclusion, That in all Eclipses, the Earth is in such a streight Line, (betwixt the two Luminaries) whose extremities do point unto opposite parts of the *Zodiack*. Now tho our Adversaries should suppose (as *Copernicus* does) the Earth to be situated in that which they would have to be the Sun's Orb; yet would there not be any Eclipse, but when the Sun and Moon were diametrically opposite, and our Earth betwixt them: As may clearly be manifested by this Figure, where you see the two Luminaries in opposite Signs; and according as any part of our Earth is situated by its diurnal Revolution, so will every Eclipse be either visible, or not visible unto it.

Arg.

Arg. 4. The last and chief Argument, is taken from the appearance of the Stars; which in every Horizon, at each hour of the Night, and at all times of the Year, seem of an equal bigness. Now this could not be, if our Earth were sometimes nearer unto them by 2000000 German miles, which is granted to be the Diameter of that Orb, wherein the Earth is supposed to move.

I answer: This Consequence will not hold, if we affirm the Earth's Orb not to be big enough for the making of any sensible difference in the appearance of the fixed Stars.

Yea, but (you will say) 'tis beyond conceit, and without all reason, to think the fixed Stars of so vast a distance from us, that our approaching nearer unto them by 2000000 German miles, cannot make any difference in the seeming quantity of their Bodies.

I reply: There is no certain way to find out the exact distance of the starry Firmament: But we are fain to conclude of it by Conjectures, according as several Reasons and Observations seem most likely unto the Fancies of divers Men. Now that this Opinion of *Copernicus* does not make it too big, may be discerned from these following Considerations.

The words, *great* and *little*, are relative terms, and do import a comparison to something else: So that where the Firmament

Arist. de
Caelo l. 2.
c. 14.

Copern.
l. 1. c. 5, 6.

ment (as it is according to Copernicus) is said to be too big; 'tis likely, that this word is to be understood in reference to some other thing of the same kind, the least of which is the Moons Orb: But now if its being so much bigger than this may be a sufficient reason, why it should be thought too great, then it seems that every thing which exceeds another of the same kind, in such a proportion, may be concluded to be of too big a quantity: and so consequently, we may affirm, that there is no such thing in the World. And hence it will follow, that Whales and Elephants are meer Chimeras, and poetical Fictions, because they do much exceed many other living Creatures. If all this eighth Sphere, (saith Galilaeus) as great as it is, were a light Body, and placed so far from us, that it appeared but as one of the lesser Stars, we should then esteem it but little; and therefore, we have no reason now to thrust it out from being amongst the Works of Nature; by reason of its too great immensity. 'Tis a frequent speech of our Adversaries, Tycho, Brahe, and others, in excuse of that incredible swiftness which they imagine in their *Primum Mobile*, That 'twas requisite the Motion of the Heavens should have a kind of infinity in it, the better to manifest the infiniteness of the Creator. And why may not we as well affirm this concerning the bigness of the Heavens? *Difficilius est accidens prater modum subiecti intendere, quam subiectum sine*

sine accidente augere, (saith Kepler.) His meaning is, that 'tis less absurd to imagine the eighth Sphere of so vast a bigness, as long as 'tis without motion, or at least, has but a very slow one; than to attribute unto it such an incredible celerity, as is altogether disproportionable to its bigness.

1. 'Tis the acknowledgment of *Clavius*, Comment. in Spher. cap. 1. and might easily be demonstrated, That if the Centre were fastned upon the Pole of the World, the Orb wherein he supposes the Sun to move, would not be able to reach so far in the eighth Sphere, (being considered according to Ptolemy's Hypothesis) as to touch the Pole-star: which notwithstanding (saith he) is so near the Pole it self, that we can scarce discern it to move: Nay, that Circle which the Pole-star makes about the Pole, is above four times bigger than the Orb of the Sun. So that according to the opinion of our Adversaries, though our Earth were at that distance from the Centre, as they suppose the Sun to be, yet would not this *Excentricity* make it nearer to any one part of the Firmament, than the Pole-star is to the Pole, which according to his confession, is scarce sensible. And therefore according to their opinion, it would cause very little difference in the appearance of those Stars, the biggest of which does not seem to be of above five Seconds in its Diameter.

3. 'Tis considerable, That the Spheres of *Saturn*, *Jupiter*, *Mars*, are, according to the general opinion, of very great extension; and yet each of them is appointed only to carry about its particular Planet, which are but very little in comparison of the fixed Stars. Now if for the situation of these fixed Stars, there should be allotted a proportionable part of the World, 'tis certain, that their Orb must be far bigger than it is commonly supposed, and very near to this Opinion of *Copernicus*.

4. We usually judg the bigness of the higher Orbs, by their different motions. As because *Saturn* finishes his course in thirty Years, and *Jupiter* in twelve, therefore we attribute unto those Orbs, such a different proportion in their bigness. Now if by this Rule we should find out the quantity of the eighth Sphere, we shall discern it to be far nearer unto that bigness, which *Copernicus* supposeth it to have, than that which *Ptolemy*, *Tycho*, and others, ordinarily ascribe unto it. For the starry Heaven (say they) does not finish his course under 26000 Years; whereas *Saturn*, which is next unto it, does compass his Orb in thirty Years. From whence it will probably follow, that there is a very great distance betwixt these in place, because they have such different terms of their Revolutions.

But against this Answer: Unto the last Argument, our Adversaries thus reply:

1. If

1. If the fixed Stars be so far distant from us, that our approaching nearer unto them by 2000000 German miles, do not make any sensible difference in their appearance, then *Gallileus* his Perspective could not make them seem of a bigger Form, than they do to the bare Eye, which yet is contrary to common experience.

Fromond.
Vest. v. 12.
5. cap. 1.

2. From hence it may be inferred, That the least fixed Star is bigger than all this Orb wherein we suppose the Earth to move; because there is none of them but are of a sensible bigness in respect of the Firmament; whereas this it seems is not.

Ibid.

3. Since God did at first create the Stars for the use of all Nations that are under the whole Heavens, Deut. 4. 19. it might have argued some improvidence in him, if he had made them of such vast magnitudes: whereas they might as well bestow their light and influences, and so consequently be as serviceable to that end for which they were appointed, if they had been made with less Bodies, and placed nearer unto us. And 'tis a common *maxime*, that Nature in all her Operations, does avoid superfluities, and use the most compendious way.

Ibid.

I answer:

1. To the first; whether the Perspective do make the fixed Stars appear bigger than they do to the bare Eye, cannot certainly be concluded, unless we had such an exact Glass, by which we might try the experiment. But if in this kind we will trust the authority

* *Astron.*
Copern.
l. 1. par. 1.

authority of others, * *Kepler* tells us, from the experience of skilful Men, that the better the Perspective is, by so much the less will the fixed Stars appear through it; being but as meer Points from which the Beams of Light do disperse themselves like Hairs. And 'tis commonly affirmed by others, that the Dog-star, which seems to be the biggest Star amongst those of the first Magnitude, does yet appear through this Glass, but as a little Point no bigger than the fiftieth part of *Jupiter*. Hence it is, that though the common Opinion hold the Stars of the first Magnitude to be two Minutes in their Diameter, and *Tycho* three; yet † *Gallileo*, who had been most versed in the Experiments of his own Perspective, concludes them to be but five Seconds.

† *System.*
mundi.
Col. 3.

2. To the second: First, we affirm the fixed Stars to be of a vast Magnitude. But however, this Argument does not induce any necessity that we should conceive them so big as the Earth's Orb. For it might easily be proved, that though a Star of the sixth Magnitude, were but equal in Diameter unto the Sun, (which is far enough from the greatness of the Earth's Orb) yet the starry Heaven would be at such a distance from us, that the Earth's annual Motion could not cause any difference in its appearance.

Vid Galil.
ibid.

Suppose the Diameter of the Sun to be about half a Degree, as our Adversaries grant; whereas a Star of the sixth Magnitude

tude is fifty Thirds, which is comprehended in that of the Sun 2160 times. Now if the Sun were removed so far from us, that its Diameter would seem but as one of that number whereof it now contains 2160, then must his distance from us be 2160 times greater than now it is: which is all one, as if we should say, that a Star of the sixth Magnitude is severed from us by so many Semidiameters of the Earth's Orb. But now, according to common consent, the distance of the Earth from the Sun, does contain 128 Semidiameters of the Earth; and (as was said before) this supposed distance of the fixed Stars, does comprehend 2160 Semidiameters of the Earth's Orb. From whence it is manifest, that the Semidiameter of the Earth, in comparison to its distance from the Sun, will be almost doubly bigger than the Semidiameter of the Earth's Orb, in comparison to this distance of the Stars. But now the Semidiameter of the Earth, does make very little difference in the appearance of the Sun, because we see common Observations upon the Surface of it, are as exactly true to the sense, as if they were made from the Centre of it. Wherefore, that difference which would be made in these fixed Stars, by the annual course of the Earth, must needs be much more unobservable, or rather altogether insensible.

2. The Consequence of this Argument, is grounded upon this false supposition, That every Body must necessarily be of an equal extension,

extension, to that distance from whence there does not appear any sensible difference in its quantity. So that when I see a Bird flying such a height in the Air, that my being nearer unto it, or farther from it, by ten or twenty Foot, does not make it seem unto my Eyes either bigger or less; then I may conclude, that the Bird must needs be either ten or twenty foot thick: Or when I see the Body of a Tree that may be half a mile from me, and perceive that my approaching nearer to it, by thirty or forty paces, does not sensibly make any different appearance; I may then infer, that the Tree is forty paces thick; with many the like absurd Consequences, that would follow from that Foundation upon which this Argument is bottom'd.

To the third, I answer: 'Tis too much presumption, to conclude that to be superfluous, the usefulness of which we do not understand. There be many secret Ends in these great Works of Providence, which humane Wisdom cannot reach unto; and as Solomon speaks of those things that are under the Sun, so may we also of those things that are above it, *That no Man can find out the Work of God, for though a Man labour to seek it out; Yea, further, Though a wise Man think to know it, yet shall he not be able to find it.* He that hath most insight into the Works of Nature, is not able to give a satisfying reason, why the Planets or Stars should be placed just at this particular distance

stance from the Earth, and no nearer or farther. And besides, this Argument might as well be urged against the *Hypothesis* of *Protony* or *Tycho*, since the Stars, for ought we know, might have been as serviceable to us, if they had been placed far nearer than either of those Authors suppose them. Again, were there any force in such a Consequence, it would as well conclude a great improvidence of Nature, in making such a multitude of those lesser Stars, which have lately been discovered by the Perspective. For to what purpose should so many Lights be created for the use of Man, since his Eyes were not able to discern them? So that our disability to comprehend all those ends, which might be aimed at in the Works of Nature, can be no sufficient Argument to prove their superfluity. Though Scripture tells us; that these things were made for our use; yet it does not tell us, that this is their only end. 'Tis not impossible, but that there may be elsewhere some other Inhabitants, by whom these lesser Stars may be more plainly discerned. And (as was said before) why may not we affirm that of the bigness, which our Adversaries do concerning the motion of the Heavens? That God; to shew his own immensity, did put a kind of infinity in the Creature.

There is yet another Argument to this purpose, urged by * *Al. Ross.* which was not * *Lib. I. referred to any of the former kind, because* *scilicet 2. c. 1.* I could scarcely believe I did rightly understand

stand it : since he puts it in the front of his other Arguments, as being of strength and subtilty enough to be a Leader unto all the rest ; and yet in the most likely sense of it, 'tis so extreamly simple to be pressed in a Controversy, that every fresh Man would laugh at it. The words of it are these : *Quod minimum est in circulo debet esse centrum illius, at Terra longè minor est Sole, & Equinoctialis Terrestris est omnium in Cælo circulus minimus, ergo, &c.*

By the same reason, it would rather follow, that the *Moon*, or *Mercury*, were in the Centre, since both these are less than the Earth. And then, whereas he says, that the Equinoctial of the Earth, is the least Circle in the Heavens, 'tis neither true nor pertinent, and would make one suspect, that he who should urge such an Argument, did scarce understand any thing in Astronomy.

There are many other Objections like unto this, not worth the citing : The chief of all have been already answered ; by which you may discern, that there is not any such great necessity, as our Adversaries pretend, why the Earth should be scituated in the midst of the *Universe*.

PROP.

P R O P. VII.

It is probable that the Sun is in the Centre of the World.

THE chief Reasons for the confirmation of this Truth, are implied in the conveniences of this *Hypothesis* above any other ; whereby we may resolve the Motions and Appearances of the Heavens, into more easy and natural Causes.

Hence will the Frame of Nature be freed from that deformity, which it has according to the *Système* of *Tycho* : who though he make the Sun to be in the midst of the Planets, yet, without any good Reason, denies it to be in the midst of the fixed Stars ; as if the Planets, which are such eminent parts of the World, should be appointed to move about a distinct Centre of their own, which was beside that of the *Universe*.

Hence likewise are we freed from many of those Inconveniences in the *Hypothesis* of *Ptolomy*, who supposed in the Heavens, *Epicyles* and *Eccentrics*, and other Orbs, which he calls the *Deferents* of the *Apoge* and the *Perige*. As if Nature, in framing this great Engine of the World, had been put unto such hard shifts, that she was fain to make use of Wheels and Screws ; and other.

H 2

the

the like Artificial Instruments of Motion.

There be sundry other Particulars, whereby this Opinion concerning the Sun's being in the Centre, may be strongly evidenced; Which because they relate unto several Motions also, cannot therefore properly be insisted on in this place. You may easily enough discern them, by considering the whole Frame of the Heavens, as they are according to the *Système* of *Copernicus*; wherein all those probable Resolutions that are given for divers appearances amongst the Planets, do mainly depend upon this Supposition, that the Sun is in the Centre. Which Arguments (were there no other) might be abundantly enough for the confirmation of it. But for the greater plenty, there are likewise these Probabilities considerable.

1. It may seem agreeable to reason, That the Light which is diffused in several Stars through the Circumference of the World, should be more eminently contained, and (as it were) contracted in the Centre of it, which can only be by placing the Sun there.

* *In primis*.
cap. Spher.

2. 'Tis an Argument of * *Clavius*, and frequently urged by our Adversaries, That the most natural situation of the Sun's Body was in the midst, betwixt the other Planets; and that for this Reason, because from thence he might more conveniently distribute amongst them both his Light and Heat.

Heat. The force of which, may more properly be applied to prove him in the Centre.

3. 'Tis probable that the Planetary Orbs (which are special parts of the *Universe*) do move about the Centre of the World, rather than about any other Centre which is remote from it. But now 'tis evident, that the Planets *Saturn*, *Jupiter*, *Mars*, *Venus*, *Mercury*, do, by their Motion, encompass the Body of the Sun. 'Tis likely therefore that this is situated in the midst of the World.

And as for the three upper Planets, 'tis found, by Observation, that they are always nearest to the Earth, when in opposition to the Sun, and farthest from us, when in conjunction with it: Which difference is so eminent, that *Mars* in his *Perige* does appear sixty times bigger, than when he is in the *Apoge*, and at the greatest distance.

Now, that the Revolution of *Venus* and *Mercury* also is about the Sun, may from hence be evidenced. First, Because they are never at any great distance from him. Secondly, Because they are seen sometimes above, and sometimes below him. Thirdly, Because *Venus*, according to her different situations, does change her appearance as the Moon.

4. There is yet another Argument, which * *Aristotle* himself doth repeat from *Pythagoras*. The most excellent Body should have the best place: but the Sun is the most ex-

* *De Calo*,
l. 2. c. 13.

H 3

cellent

cellent Body, and the Centre is the best place; therefore 'tis likely the Sun is in the Centre. In the Frame of Nature (which is supposed to be of an orbicular Form) there are but two places of any eminency, the Circumference and the Centre. The Circumference being of so wide a capacity, cannot so fitly be the peculiar Seat of a Body, that is so little in respect of it: And besides, that which is the most excellent part of the World, should be equally preserved in it self, and shared in its Vertues by all the other parts, which can only be done, by its being placed in the midst of them. This is intimated unto us, in that frequent Speech of *Plato*, that the Soul of the World does reside in the innermost place of it: And that in * *Macrobius*, who often compares the Sun in the World, to the Heart in a living Creature.

* *Saturnal. lib. 1. c. 17, &c.*

Unto this *Aristotle* answers by a distinction: There is *medium magnitudinis*, so the Centre is in the middle of the Sphere: And there is *medium naturæ, or informationis*, which is not always the same with the other; for in this sense the Heart is in the middle of a Man; because from thence (saith he) as from the Centre, the vital Spirits are conveyed to all the Members: and yet we know that it is not the Centre of Magnitude, or at an equal distance from all the other parts.

And besides; the middle is the worst place, because most circumscribed, since that is more

more excellent, which does limit any thing, than that which is bounded by it. For this reason is it, that Matter is amongst those things which are terminated, and Form that which does circumscribe.

But against this answer of *Aristotle*, it is again replied:

1. Though it be true, that in living Creatures, the best and chiefeft part is not placed always just in the midst; yet this may be, because they are not of an orbicular Form, as the World is.

Keplar. Astr. Copern. lib. 2. par. 2.

2. Though that which bounds another thing, be more excellent than that which is terminated by it, yet this does not prove the Centre to be the worst place, because that is one of the Terms or Limits of a round Body, as well as the Circumference.

There are likewise other Arguments to this purpose, much insisted on by eminent Astronomers; taken from that Harmonical Proportion which there may be betwixt the several distances and bigness of the Orbs, if we suppose the Sun to be in the Centre.

Massin. præ. ad Narrat. Rhetic. Keplar. mysterium Cosmographicum.

For according to this (say they) we may conceive an excellent harmony, both in the number and the distance of the Planets; (and if God made all other things, *numero & mensurâ*, much more then those greater Works, the Heavens) for then the five Mathematical Bodies, so much spoken of by

* *Lib. 13. prop. 14. 15, &c.*

* *Euclid*, will bear in them a proportion

answerable to the several distances of the Planets from one another.

Thus a *Cube* will measure the distance betwixt *Saturn* and *Jupiter*; a *Pyramis* or *Tetraëdron*, the distance betwixt *Jupiter* and *Mars*; a *Dodecaëdron*, the distance betwixt *Mars* and the *Earth*; an *Icosaëdron*, the distance betwixt the *Earth* & *Venus*; and an *Octoëdron*, the distance betwixt *Venus* & *Mercury*: that is, if we conceive a Circumference described immediately without the *Cube*, and another within it, the distance between these two, will shew what proportional distance there is betwixt the Orb of *Saturn*, and that of *Jupiter*. Thus also, if you conceive a Circumference described on the outside of a *Pyramis*, or *Tetraëdron*, and another within it, this will shew such a proportional distance, as there is betwixt the Orb of *Mars*, from that of *Jupiter*. And so of the rest.

Now if any ask why there are but six Planetary Orbs? *Keplar* answers, *Quia non oportet plures quam quinque proportiones esse, totidem nempe quot regularia sunt in Mathesi corpora. Sex autem termini consummant hunc proportionum numerum*: Because there are but five proportions, so many as there are regular Bodies in Mathematicks, each of whose Sides and Angles are equal one to another. But now there are six terms required to consummate this number of proportions; and so consequently, there can be but six primary Planets.

Thus

Thus likewise, by placing the Sun in the Centre, we may conceive such a proportion betwixt the Bodies of the Planets, as will be answerable unto their several Spheres: Then *Mercury*, which has the least Orb, will have the least Body; *Venus* bigger than that, but less than any of the other; our *Earth* bigger than *Venus*, but less than the rest; *Mars* bigger than the *Earth*, but less than *Jupiter*; *Jupiter* bigger than *Mars*, and less than *Saturn*; *Saturn* being the highest, should also be the biggest. All which Harmony would be disturbed, by putting in the Sun amongst them; and therefore, it may be more convenient for him to sit still in the Centre.

There are sundry other Arguments in this kind to be found out, by a consideration of this whole *Hypothesis*: He that does rightly understand it, may therein easily discern many strong Probabilities, why the Sun should be in the midst of the World, rather than in any other Position.

PROP.

P R O P. VIII.

That there is not any sufficient reason to prove the Earth incapable of those motions which Copernicus ascribes unto it.

THE two chief Motions in the World, which are more especially remarkable above the rest, are the *Diurnal*, and *Annual*.

The *Diurnal*, which makes the difference betwixt Night and Day, is caused by the Revolution of our Earth upon its own *Axis*, in the space of four and twenty hours.

The *Annual*, which makes the difference betwixt Winter and Summer, is likewise caused by the Earth, when being carried through the *Ecliptick* in its own Orb, it finishes its course in a Year.

The first is usually stiled, *Motus Revolutionis*: The second, *Motus Circumlationis*: There is likewise a third, which Copernicus calls, *Motus Inclinationis*: But this being thoroughly considered, cannot properly be stiled a Motion, but rather an Immutability, it being that whereby the *Axis* of the Earth does always keep parallel to it self; from which situation, it is not its Annual Course that does make it in the least manner to decline.

As

As for the Difficulties which concern the second of these, they have been already handled in the sixth Proposition, where the Earth's *Eccentricity* was maintained.

So that the chief business of this Chapter, is to defend the Earth's Diurnal Motion, against the Objections of our Adversaries. Sundry of which Objections, to speak (as the Truth is) do bear in them a great shew of probability, and such too (as it seems) was very efficacious; since *Aristotle* and *Ptolomy*, &c. Men of excellent Parts, and deep Judgments, did ground upon them, as being of infallible and necessary consequence.

I shall reckon them up severally, and set down such Answers unto each, as may yield some satisfaction to every indifferent seeker of Truth.

First then, 'tis objected from our senses; If the Earth did move, we should perceive it. The Western Mountains would then appear to ascend towards the Stars, rather than the Stars to descend below them.

I answer: The sight judges of Motion, according as any thing does desert the Plane whereon it self is seated: which Plane every where keeping the same situation and distance, in respect of the Eye, does therefore seem immovable unto it, and the motion will appear in those Stars and parts of the Heaven, through which the Vertical Line does pass.

The

The reason of such deceit may be this : Motion being not a proper Object of the Sight, nor belonging to any other peculiar Sense, must therefore be judged of by the *sensus communis*, which is liable to mistake in this respect ; because it apprehends the Eye it self to rest immovable, whilst it does not feel any Effects of this Motion in the Body : As it is when a Man is carried in a Ship ; so that Sense is but an ill Judg of Natural Secrets. 'Tis a good Rule of *Plato*, *Εἰς τὸ νῆον ἀφορῶν δεῖ φιλόσοφον εἶναι, μὴ εἰς τὴν ὁψίν* : A Philosopher must not be carried away by the bare appearance of things to sight, but must examine them by reason. If this were a good Consequence, The Earth does not move, because it does not appear so to us ; we might then as well argue, that it does move when we go upon the Water ; according to the Verse :

Provehimur portu, terraque, verbesq; recedunt.

Or if such Arguments would hold, it were an easy matter to prove the Sun and Moon not so big as a Hat, or the fixed Stars as a Candle.

*Al. Ross.
l. 1. scilicet 1.
cap. 1.*

Yea, but if the Motions of the Heavens be only apparent, and not real, then the Motion of the Clouds will be so too, since the Eye may be as well deceived in the one as the other.

Answer : 'Tis all one, as if he should infer, that the sense was mistaken in every thing,

thing, because it was so in one thing : And this would be an excellent Argument to prove that Opinion of *Anaxagoras*, that the Snow was black.

The reason why that motion which is caused by the Earth, does appear as if it were in the Heavens, is, because the *sensus communis*, in judging of it, does conceive the Eye to be it self immovable, (as was said before) there being no sense that does discern the effects of any motion in the Body ; and therefore, it does conclude every thing to move, which it does perceive to change its distance from it : So that the Clouds do not seem to move sometimes, when as notwithstanding they are every where carried about with our Earth, by such a swift revolution ; yet this can be no hindrance at all, why we may not judge aright of their other particular Motions, for which there is not the same reason. Though to a Man in a Ship, the Trees and Banks may seem to move ; yet it would be but a weak Argument, to conclude from thence, that therefore such a one could not tell whether his Friend does really stir, whom he sees to walk up and down in the Ship : or that he might as well be deceived in judging the Oars to move, when they do not.

'Tis again replied by the same Objector, That it is not credible, the Eye should be mistaken in judging of the Stars and Heavens ; because those being light Bodies, are the primary & proper Objects of that Sense.

I answer : The deceit here, is not concerning the Light or Colour of those Bodies; but concerning their Motion; which is neither the primary nor proper Object of the Eye, but reckoned amongst the *Objecta Communia*.

2. Another common Argument against this Motion, is taken from the danger that would thence arise unto all high Buildings, which by this would quickly be ruined and scattered abroad.

I answer : This Motion is supposed to be natural; and those things which are according to Nature, have contrary effects to other matters, which are by force and violence. Now it belongs unto things of this latter kind, to be inconstant and hurtful; whereas those of the first kind must be regular, and tending to conservation. The Motion of the Earth, is always equal and like it self; not by starts and fits. If a Glass of Beer may stand firmly enough in a Ship, when it moves swiftly upon a smooth stream; much less then will the Motion of the Earth, which is more natural, and so consequently more equal, cause any danger unto those Buildings that are erected upon it. And therefore to suspect any such event, would be like the fear of *Lactantius*, who would not acknowledg the being of any *Antipodes*, lest then he might be forced to grant that they should fall down unto the Heavens. We have equal reason to be afraid of high Buildings, if the whole World
above

Gilbert. de
Magn. l. 6.
c. 5.

above us were whirled about with such a mad celerity as our Adversaries suppose; for then there would be but small hopes, that this little point of Earth should escape from the rest.

But supposing (saith * *Rosse*) that this Motion were natural to the Earth, yet it is not natural to Towns and Buildings, for these are Artificial. *Lib. 1. sect. 1. cap. 3.*

To which I answer : Ha, ha, ha.

3. Another Argument to this purpose, is taken from the rest and quietness of the Air about us; which could not be, if there were any such swift Motion of the Earth. If a Man riding upon a fleet Horse, do perceive the Air to beat against his Face, as if there were a Wind, what a vehement Tempest should we continually feel from the East, if the Earth were turned about with such a swift revolution as is supposed?

Unto this 'tis usually answered, That the Air also is carried along with the same motion of the Earth : For if the Concavity of the Moon's Orb, which is of so smooth and glabrous a Superficies, may (according to our Adversaries) drive along with it the greatest part of ~~this~~ Elementary World, all the Regions of Fire, and all the vast upper Regions of Air, and (as some will have it) the two lower Regions, together with the Sea likewise; for from hence (saith *Alex. Rosse*, *lib. 1. sect. 1. cap. 3.*) is it, that betwixt the *Tropicks* there is a constant Eastern Wind, and a continual flowing of the Sea
West-

Westward: I say, if the Motion of the Heavens, which are smooth Bodies, may be able to carry with it so great a part of the Elementary World: or if the rugged parts of the Moon's Body, be able to carry with it so great a part of the Air, as *Fromondus* (*Ant. c. 16.*) affirms; much more then may our Earth, which is a rugged mountainous Body, be able to turn about so little a part of the World, as that vaporous Air next unto it.

Suppose the inward Circle to represent the Earth; and the outward, the thicker Air which encompasses it. Now it is easily conceivable, that the revolution of so great a Body as this Globe of Earth, may turn about

about by its meer motion, (if there were nothing else): so little a part of the adjoining Air, as is here represented: And yet,

1. The disproportion betwixt the thickness of the Earth, and this Orb of Air, is far greater than could be exprest in the Figure, being but as twenty miles, which is at most the thickness of this Air, unto 3456 miles, which is the Semidiameter of our Earth, and so is but as an insensible number in respect of this other.

2. Besides the meer motion of the Earth, which in probability (being such a rugged Body) might be enough to carry so little a part of the Air along with it; there is also (as we suppose) a magnetical vigour which proceeds from it, whereby 'tis more able to make all things that are near unto it, to observe the same Revolution.

But if it be so (saith * *Alex. Ross.*) that not only the Man, but the *Medium* also, and the Object be moved, this must needs be such a great hindrance to the sight, that the Eye cannot judg exactly of any thing. For suppose the Man alone to be in a motion, he could not see so well as when he is still; but now, if not only he, but his Spectacles, and Book, were all moved, he would not be able to discern any thing distinctly. * Lib. 1. sect. 1. c. 5.

I answer: The Consequence were pertinent, if all these were several motions: but if the Subject, and *Medium*, and Object, were all carried with one and the same equal motion, (as it is here supposed) this could

be no impediment to the Act of seeing, but it would be all one with the rest; because by this means, they are not severed from one another; and therefore the species are not disturbed. 'Tis an excellent saying of * *Gallileus*, and may serve for the resolution of many such Doubts as these; *Motus catenus tanquam motus operatur, quatenus relationem habet ad ea res quæ ipso destinantur; in his vero rebus, quæ totæ aequaliter de ea participant, nihil operatur, & ita se habet ac si nullus esset.* If a Man be within some Room of a Ship, he may read altogether as easily when the Ship moves, as when it stands still.

4. Another Argument against this circular motion of the Earth, is grounded upon that common Principle amongst the *Aristotelians*; *Unius corporis simplicis unus tantum est motus*: One kind of Body, has but one kind of Motion. But now; the Earth and Water hath a motion of descent: the Air, a motion of ascent; and therefore none of them can have any circular motion natural unto them.

I answer: First, These right Motions of Elementary Bodies, belong only to the parts of them, and that too when they are out of their proper places; so that the whole to which they belong, may, notwithstanding this, have another Motion of its own. But, secondly, this saying which *Aristotle* calls a Principle, will not consist with other evident Experiments of Nature. Thus, though

* *Syst.
mundi,
Colloq. 2.*

a

a Loadstone, in respect of its matter and condensity, naturally tends downward; yet this does not hinder, but that in respect of some other qualities, as its desire of union and coition to another Loadstone, it may also naturally move upwards. From whence it will follow, that the same Elementary Body, may have divers natural Motions.

5. The gravity and magnitude of this Earthy Globe, do make it altogether unfit for so swift a Motion.

I answer: First, Heaviness can only be applied unto those Bodies which are out of their proper places, or unto such parts, as are severed from the whole to which they belong. And therefore the Globe of Earth, considered as whole, and in its right place, cannot truly be called heavy. I deny not, but that there is in it, and so likewise in the other Planets, an ineptitude to motion, by reason of the matter and condensity of their Bodies: And so likewise there is, as truly, (though not according to the same degrees) in the least particle of a material condensed Substance: so that this cannot reasonably be pretended as a just Impediment; why the Earth should be incapable of such a Motion. Secondly, And though this Globe be of so vast a magnitude, yet, as Nature bestows upon other Creatures (for instance, an Eagle and a Fly) Spirits, and motive Powers, proportionable to their several Bodies: so likewise may she endow

f 2

the

the Earth with a motive Faculty answerable to its greatness. Or if this may make the Earth incapable of so swift a motion as is supposed, much more then will the Heavens be disabled for that greater swiftness which is imagined in them. I might add, the Globe of the Sun, and *Jupiter*, are observed to move about their own Centres; and therefore the Earth, which is far less than either of them, is not, by reason of its too great magnitude, made unfit for such a Revolution. Thirdly, As for the swiftness of the Earth's Course, it does not exceed (all Circumstances well considered) the celerity of some other Motions, with which we are acquainted; as that of the Clouds, when driven by a tempestuous Wind; that of a Bullet shot from a Canon, which in the space of a minute flies four miles. Or, as another hath observed, in the second scruple of an hour, it may pass the fifteenth part of a German mile: Than which, there is not any Point in the Earth's Equinoctial that moves faster; and though a Bullet be much slower in moving a greater distance, yet for so little a space, while the force of the Powder is most fresh and powerful, it does equal the swiftness of the Earth. And yet,

1. A Bullet, or Cloud, is carried in its whole Body, being fain to break its way through the Air round about it: but now the Earth (in respect of this first Motion) does remain still in the same situation,

*Metaph.
physic. ad
Natura.
Rhet.
Promond.
Physic.
lib. I.
cap. 3.*

ation, and move only about its own Centre.

2. The Motion of a Bullet is violent, and against its Nature, which does strongly incline it to move downwards. Whereas the Earth being considered as whole, and in its proper place, is not heavy, nor does it contain any repugnancy to a Circular Motion.

6. The chief Argument on which our Adversaries do most insist, is this: If there were such a Motion of the Earth as is supposed; then those Bodies which are severed from it in the Air, would be forsaken by it. The Clouds would seem to rise and set as the Stars. The Birds would be carried away from their Nests. No heavy Body could fall perpendicular. An Arrow or Bullet being shot from East to West, by the same violence, will not be carried an equal distance from us, but we should, by the revolution of our Earth, overtake that which was shot to the East, before it could fall. If a Man, leaping up, should abide in the Air but one second scruple of an hour, or the sixtieth part of a minute, the Earth, in that space, would withdraw it self from him almost a quarter of a mile. All these, and many other such strange Inferences, which are directly contrary to sense and experience, would follow from this motion of the Earth.

*Aristot. de
Caelo, l. 2.
c. 13.*

There are three several ways most frequently used for the resolving of these kind of Doubts.

1. From those Magnetical Qualities, which all Elementary Bodies do partake of.
 2. From the like motions of other things within the room of a sailing Ship.
 3. From the like participation of motion in the open parts of a Ship.
1. For those Magnetical Properties, with which all these Bodies are endowed. For the better understanding of this, you must know, That besides those common Elementary Qualities of Heat, Coldness, Dryness, Moisture, &c. which arise from the predominancy of several Elements; there are likewise other Qualities (not so well known to the Ancients) which we call *Magnetical*, of which every Particle in the Terrestrial Globe does necessarily participate: and whether it be joined to this Globe by continuity or contiguity; or whether it be severed from it, as the Clouds in the second Region, a Bird, or Bullet in the Air; yet does it still retain its Magnetical Qualities, together with all those Operations that proceed from them.

Now from these Properties do we suppose the Circular Motion of the Earth to arise.

If you ask, What Probabilities there are, to prove that the Earth is endowed with any such affections? I answer: 'Tis likely, that

the lower parts of this Globe, do not consist of such a soft fructifying Earth, as there is in the Surface, (because there can be no such use for it as here, and Nature does nothing in vain) but rather of some hard rocky substance, since we may well conceive, that these lower parts are pressed close together, by the weight of all those heavy Bodies above them. Now, 'tis probable, that this rocky Substance is a Loadstone, rather than a *Jasper*, *Adamant*, *Marble*, or any other; because experience teacheth us, that the Earth and Loadstone do agree together in so many Properties. Suppose a Man were to judge the Matter of divers Bodies; each of which should be wrap'd up in some covering from his Eye, so that he might only examine them by some other outward signs: If in this examination, he should find any particular Body which had all the Properties that are peculiar to a Loadstone, he would in reason conclude it to be of that Nature, rather than any other. Now there is altogether as much reason why we should infer, that the inward parts of the Earth do consist of a Magnetical Substance. The agreement of these two, you may see largely set forth in the Treatise of Dr. *Gilbert*. I will instance only in one Example, which of it self may sufficiently evidence, that the Globe of Earth does partake of the like affections with the Loadstone. In the Mariner's Needle, you may observe the Magnetical Motions of *Directi-*

on, Variation, Declination; the two last of which are found to be indifferent, according to the variety of places. Now this difference cannot proceed from the Needle it self, because that is the same every where. Nor can we well conceive how it should be caused by the Heavens; for then the Variation would not be always alike in the same place, but diverse, according to those several parts of the Heaven, which at several times should happen to be over it: And therefore it must necessarily proceed from the Earth, which being it self endowed with Magnetical Affections, does diversly dispose the Motions of the Needle, according to the difference of that disponent virtue, which is in its several Parts.

Now, to apply this unto the particular Instances of the Objection: We say, though some parts of this great Magnet, the Earth, may, according to their Matter, be severed from the whole; yet are they always joined to it, by a communion of the same Magnetical Qualities; and do no less observe these kind of Motions, when they are separated from the whole, than if they were united to it. Nor need this seem incredible, that a heavy Bullet, in such a swift violent course, should be able to observe this Magnetical Revolution of the whole Earth; when as we see that those great Bodies of *Saturn*, *Jupiter*, &c. hanging in the vast spaces of the *Ætherial Air*, do so constantly and regularly move on in their appointed courses.

Though

Though we could not shew any similitude of this Motion in these inferior Bodies, with which we are acquainted; yet we must know, there may be many things which agree to the whole Frame, that are not discernable in divers parts of it. 'Tis natural unto the Sea to ebb and flow, but yet there is not this Motion in every drop or bucket of Water. So if we consider every part of our Bodies severally, the Humors, Bones, Flesh, &c. they are all of them apt to tend downwards, as being of a condensed Matter; but yet consider them according to the whole Frame, and then the Blood or Humors may naturally ascend upwards to the Head, as well as descend to any of the lower parts. Thus the whole Earth may move round, though the several parts of it have not any such particular Revolution of their own. Thus likewise, though each condensed Body being considered by it self, may seem to have only a Motion of descent, yet in reference to that whole Frame, of which it is a part, it may also partake of another Motion that may be natural unto it.

But some may here object: Though the Earth were endow'd with such Magnetical Affections, yet what probability is there that it should have such a Revolution? I answer: 'Tis observed of those other Magnetical Bodies of *Saturn*, *Jupiter*, and the Sun, that they are carried about their own Centers; and therefore 'tis not improbable, but

but that it may be so with the Earth also: which if any deny, he must shew a reason why in this respect they should be unlike.

Yea, but though the Earth did move round, what ground is there to affirm, that those Bodies which are severed from it, as a Bullet, or the Clouds, should follow it in the same course?

I answer: Those Spots which are discovered about the Sun, and are thought to be Clouds or Evaporations from his Body, are observed to be carried about according to his Revolution. Thus the Moon is turned round by our Earth; the four lesser Planets by the Body of *Jupiter*. Nay, thus all the Planets, in their several Orbs, are moved about by the Revolution of the Sun upon its own *Axle* (saith *Kepler*) and therefore much more may an Arrow, or Bullet, be carried round by the Magnetical Motion of our Earth.

The second way, whereby some answer unto the Instances of this Argument, is, by shewing the like Motions of other things, within some Room of a sailing Ship. Thus Experience teaches, (say they) that a Candle, as also the Fumes that come from it, will always keep the same situation, in the swiftest motion of a Ship, as if it did rest immovably, and the Flame will not more especially bend one way, or have any troubled fluctuation, but burn as straight and quietly, as if it did stand still. Again, it

has

has been found, (say those that have been versed in these kind of Experiments) that the same force will cast a Body but an equal distance, whether or no the Body do move with, or against the motion of the Ship. As also, that any Weight being let fall, will descend in as true a perpendicular, as if the Ship did stand still. If a Man, leaping up, do tarry in the Air one second scruple of an hour, yet the Ship will not, in its greatest swiftness (as it should according to the calculation of our Adversaries) be carried from him at least fifteen foot. If we suppose a Man to jump in such a Ship, he will not be able to pass farther, when he jumps against the motion of it, than when he jumps with it. All which Particulars may argue, that these things are carried along together, by the common motion of the Ship. Now if Bodies may be thus jointly moved by such a preternatural motion, much more then will they accompany the Earth in its Diurnal Revolution, which we suppose to be natural unto them, and as a Law imposed by God in their first Creation.

If the Flame of a Candle, or the Smoke that comes from it, (things that are so easily moveable) are, notwithstanding, carried so equally, and without any disturbance, by the motion of a Ship; then also the Clouds in the Air, and all other light Bodies, may well enough be turned about by the Revolution of our Earth.

If

If an equal force will cast an heavy Body but at an equal distance, whether or no it move with, or against the motion of the Ship; then may we easily conceive, that an Arrow, or Bullet, being shot with the same violence, will pass but the same space on the Earth, whether or no it be shot towards the East or West.

If a heavy Body, while the Ship does move, will fall down in a straight Line; then it is not the Revolution of our Earth that can hinder a perpendicular descent.

If a Man, leaping up in a Ship, may abide in the Air one second scruple of an hour, and yet this Ship, in its greatest swiftness, not withdraw it self fifteen foot; then will not the Earth, in that space, go from him almost a quarter of a mile.

Fromond.
Vest. 2.
1758 2.
cap. 2.

But against this, 'tis Objected, That the Earth has the similitude of an open Ship, and not of any Room that is close. And tho it be true, that when the Roof and the Walls do all move together, the Air which is included betwixt them, must be carried along by the same motion; yet it is not so with the Earth, because that hath not any such Walls or Roof, wherein it may contain and carry along with it the *Medium*. And therefore Experience will rather argue against this supposed Revolution. Thus 'tis observed, that a Stone being let fall from the Mast of a Ship, that moves swiftly, will not descend to the same point, as if the Ship did stand still. From whence it will follow, that

that if our Earth had such a Circular Motion, then any heavy Body, being let fall from some high Tower, or other steep place, would not descend unto that point of Earth which was directly under it at the beginning.

To this we answer: That the Air which moves along with our Earth, is as well limited in certain bounds, as that which is included in a Room. If you ask where these Bounds are terminated: I answer, Neither by the utmost parts of the World, nor yet by the Concavity of the Moon's Orb, (as *Fromondus* would have us affirm) but by the Sphere of vaporous Air that encompasses our Earth; or which is all one, by the Orb of Magnetical Vigour, which proceeds from it. And besides, 'tis considerable, that all Earthly Bodies are not only contained within these limits, as things are in a close Room, but also as parts in that Whole to which they belong.

2. Though the carrying along of the *Medium*, may solve the motion of light Bodies in a Ship, as the Flame of a Candle, Smoke, or the like, yet this cannot concur to that which hath been said of heavy Bodies, as a Man leaping up, a Bullet descending, &c. since it is not the motion of the meer Air that is able to make these partake of the same motion with the Ship. Unto that Argument which he urges from the Experiment of a Stone falling in an open Ship: We answer:

1. Though

1. Though the instance of a Ship, may serve as a proof for this opinion; it being an Argument, *a minori ad maius*, from an accidental Motion; to a natural; yet it will not serve against it. For though it were not thus in accidental Motions; yet this would not hinder but that it might be so in those that are supposed to be proper and natural.

2. As for that Experiment it self, 'tis but a groundless imagination, and was never yet confirmed by any particular Experience, because 'tis certain the Event would be clean otherwise; as shall be proved in the third way of answering.

3. The third and last way of clearing the Doubts in the sixth Argument; is, by shewing the like participation of motion, in those things that are in the open parts of a Ship. To which purpose *Galileus* urges this Experiment: If any one should let fall a Stone from an high Mast, he would find, *Lapidem in eundem semper Navis locum decidere, seu consistat illa, seu quacumque velocitate moveatur*: That the Stone would always descend unto the very same place, whether or no the Ship did move or stand still. The Reason of which is, because the Motion of the Ship is likewise impressed in the Stone: which Impression is not equally prevalent in a light Body, as a Feather, or Wool; because the Air, which has power over them, is not carried along by the same motion of the Ship. Thus likewise will it be in this other experi-

*Syst. Math.
di. Col-
log. 2.*

experiment; If a Man upon a running Horse, should, in his swiftest course, let fall a Bullet, or Stone, these heavy Bodies, besides their own descent, would also participate that transverse motion of the Horse. For as those things that are thrown from us, do continue their motion when they are out of the hand in the open Air: so likewise must it be, when the force is conferred by that motion which the Arm has from the Horse. While a Man is riding, his Arm is also carried by the same swiftness of the Horse; therefore, if he should only open his Hand, and let fall any thing, it would not descend in a strait Line, but must necessarily be driven forward, by reason of that force impressed in it by the swiftness of the Horse, which is also communicated to the Arm; it being all one in effect, whether or no the Arm be moved by a particular motion of its own, as it is in casting of things from us, or by the common motion of the Body, as it is in dropping any thing from us, either when we are on the top of some sailing Ship, as in the former, or on some running Horse, as in the latter Instance.

What hath been said concerning the Motion of *descent*, is likewise applicable, both to that which is *upward*, and that which is *transversal*. So that when 'tis objected, If the Earth did move, then a Bullet there were shot up perpendicularly, would be forsaken by it, and not descend to the place from whence it arose: We answer; That the

the Cannon vvhich is upon the Earth, together vvith the Bullet in it, do partake of the same Circular Motion vvith the Earth; and this perhaps our Adversaries vvill grant, vvhist vve suppose the Bullet to remain still in the Cannon, all the difficulty vvill be, to shew hovv it must necessarily observe the same motion, vvhen it is shot out into the open Air.

Gallil. Syst. Collog. 2. For the better explication of this, you may note this following Figure.

Where vve suppose A C to be a Cannon perpendicularly erected, vvith a Bullet in it at B; vvhich if it vvere immovable, vve grant that the Bullet being discharged, must ascend in a iust perpendicular. But novv, conceive this Cannon to move along vvith the Earth, then in that space of time, vvile the Bullet, by the force of the Povvder, is ascending to the top of the Bore, the Cannon

non will be transferred to the scituation D E, so that the Bullet must be moved according to the Line F G, which is not directly upright, but somewhat declining. Now, the motion of the Bullet in the Air; must necessarily be conformed unto that direction that is impressed in it by the Cannon from whence it is shot, and so consequently it must be continued; according to the Line F G, and therefore will always keep perpendicularly over the Point from which it did ascend.

If you reply, That the motion of the Bullet in the Cannon; must needs be so swift, that the Earth cannot carry the Cannon from C to E, in the same space of time wherein the Bullet does move from B to A.

I answer: 'Tis not material whether the Earth be of a greater or lesser swiftness than the Bullet, because the Declination must always be proportionable to the motion of the Earth; and if we suppose this to be slower than the Bullet, then the Declination of the Line F G, will be so much the less.

This Truth may yet further be illustrated by the practice of those Fowlers, who use to kill Birds as they are flying; Concerning which Art, 'tis commonly thought, that these Men direct their Aims to some certain space in the Air, just before the Birds, where they conceive the Shot will meet with them in their flight; whereas, the truth is, they proceed in this case, the very same way as if the

K

Birds

Birds did stand still, by a direct aiming at their Bodies, and following of their flight by the motion of the Piece; till at length, having got a perfect aim, they discharge, and do hit altogether as surely, as if the Birds were sitting upon a Tree. From whence we may observe, that the motion of the Piece, as in our aiming, it is made to follow the Birds in their flight, (though it be but slow) yet is communicated to the Bullet in the Air.

But here it may seem very difficult to give any reason, according to those grounds concerning the flight of Birds; which being animated, have a liberty to fly here or there, to tarry, for a good space of time, in the open Air; and so 'tis not easy to conceive what means there is, by which they should participate of the Earth's Diurnal Revolution.

To this *Gallilæus* answers, That the motion of the Air, as it does turn about the Clouds, so doth it also carry with it the Birds, together with such other like things that are in it. For if some violent Wind be able to drive, with such swiftness, a full laden Ship, to throw down Towers, to turn up Trees, and the like; much more then may the Diurnal Motion of the Air (which does so far exceed in swiftness the most tempestuous Wind) be able to carry with it the Bodies of Birds.

Object.

But if all things be turned about by this Revolution, then it should seem there is no such

such thing as a right Motion, whether of Ascend or Descend, in a streight Line.

I answer: The moving of heavy or light *Sol.* Bodies, may be considered in a double relation.

1. According to the space wherein they move, and then we grant their Motions not to be simple, but mixed of a direct and circular.

2. According to the Body or *medium* wherein they move, and then they may properly be said to have right motions, because they pass through the *medium* in a streight Line; and therefore it is, that unto us they seem directly to ascend or descend. *Aristotle* himself would not deny, but that Fire may ascend in a streight Line unto its Sphere, and yet participate also of that Circular Motion which he supposes to be communicated from the Heavens, unto the upper part of the Air, and its own Region. So likewise must it be for the descent of any thing. Suppose a Ship in its swiftest motion, and a Man in it, having some Vessel filled with Water, should let fall into it a little Ball of Wax, or some other matter which may be slow in its sinking, so that in one minute it should scarce descend the space of a Cubit, though the Ship (it may be) in the same time may pass at least a hundred Cubits; yet would this still seem unto the eye to descend in a streight Line; and the other motion, which is communicated unto it by the Ship, would not at all be discernable to it.

K 2

And

And though in this case, the motion were in it self composed of a circular and direct; yet in respect of us it would appear, and so might be stiled exactly streight.

Now if it be thus in those which are generally granted to be preternatural Motions; we need not doubt then the possibility of the like effect in that Motion which we conceive to be proper and natural, both to the Earth, and the things that belong unto it.

* *Austrica Syder.*
par. 2.
prop. 25.

There is yet another Objection to this purpose urged by * *Malapertius*, a late Jesuit, who though he does with much eagerness press this Argument concerning a Bullet or Stone, against the Opinion of *Copernicus*; yet he grants that it might easily be resolved, if the defenders of it would affirm that the Air did move round with the Earth. But this (saith he) they dare not avouch; for then the Comets would always seem to stand still, being carried about with the Revolution of this Air, and then they could not rise or set, as experience shews. they do.

To this it may be answered, That most Comets are above that Sphere of Air which is turned round with our Earth, as is manifest by their height. The motion that appears in them, is caused by the Revolution of our Earth, whereby we are turned from them.

As for those which are within the Orb of our Air, these do seem to stand still. Such

a

a one was that mentioned by † *Josephus*, † *De bello Judaico*, which did constantly hang over *Jerusalem*; and that likewise which appeared about the time of *Agrippa's* death, and for many days together did hang over the City of *Rome*. Wherefore * *Seneca* does well distinguish out of *Epigenes*, betwixt two sorts of Comets, the one being low, and such as seems immovable; the other higher, and such as did constantly observe their risings and settings, as the Stars. ** Nat. Qu. l. 7. c. 12. Dion. l. 54.*

I have done with all the Arguments of any note or difficulty, that are urged against this diurnal motion of the Earth. Many other Cavils there are not worth the naming, which discover themselves to be rather the Objections of a captious, than a doubtful mind. Amongst which, I might justly pass over those that are set down by * *Alex. Rosse*: But because this Author does proceed in his whole with so much scorn and triumph, it will not be amiss therefore to examine what infallible evidence there is in those Arguments upon which he grounds his boastings. ** Lib. 1. sect. 2. c. 6.*

We have, in one Chapter, no less than these nine.

Arg. 1. If the Earth did move, then would it be hotter than the Water; because motion does produce heat; and for this reason likewise, the Water would be so hot and rarified, that it could not be congealed; since that also does partake of the same motion with the Earth.

K 3

Arg.

That the Earth may be a Planet.

Arg. 2. The Air which is next the Earth, would be purer, as being rarified with Motion.

Arg. 3. If the Earth did move the Air, it would cause some sound; but this is no more audible, than *Pythagoras* his Harmony of the Heavens.

Arg. 4. 'Twould have been in vain for Nature to have endowed the Heavens with all conditions requisite for motion, if they had been to stand still: As, first, they have a round Figure. Secondly, They have neither gravity nor levity. Thirdly, They are incorruptible. Fourthly, They have no contrary.

Arg. 5. All similiary parts are of the same nature with the whole: But each part of the Earth does rest in its place; therefore also doth the whole.

Arg. 6. The Sun in the World, is as the Heart in a Man's Body: But the Motion of the Heart ceasing, none of the Members do stir; therefore also if the Sun should stand still, the other parts of the World would be without motion.

Arg. 7. The Sun and Heavens, do work upon these inferior Bodies by their Light and Motion. So the Moon does operate upon the Sea.

Arg. 8. The Earth is the Foundation of Buildings; and therefore must be firm and stable.

Arg. 9. 'Tis the constant opinion of Divines, that the Heavens shall rest after the Day

That the Earth may be a Planet.

Day of Judgment; which they prove from *Isa. 60. 20.* *Thy Sun shall no more go down, neither shall thy Moon withdraw it self.* So likewise, *Rev. 10. 6.* The Angel swears, *that there shall be time no longer:* and therefore the Heavens must rest, since by their motion it is that Time is measured. And *St. Paul* says, *Rom. 8. 20.* *That all the Creatures are made subject to Vanity.* Now this can be no other in the Heavens, than the Vanity of Motion, which the Wise Man speaks of, *Eccles. 1. 4.* *The Sun riseth, and the Sun goeth down, &c.*

To these it may be answered:

Ad 1. & 2. In the first you may note a manifest contradiction, when he will have the Earth to be hotter than the Water, by reason of this motion; when as notwithstanding he acknowledges the Water to move along with it; and therefore too, in the next Line, he infers that the Water, because of that heat and rarefaction which it receives from this motion with the Earth, must be incapable of so much cold, as to be congealed into Ice.

But unto that which may be conceived to be his meaning in this and the next Argument: I answer, If he had fully understood this Opinion which he opposes, he would easily have apprehended, that it could not be prejudiced by either of these Consequences. For we suppose, that not only this Globe of Earth and Water, but also all the vaporous Air which invirons it, are carried

along by the same motion. And therefore, though what he says concerning the heat, which would be produced by such a motion, were true; yet it would not be pertinent, since our Earth and Water, and the Air next unto them, are not by this means severed from one another, and so do not come within the compass of this Argument.

If any reply, That this will notwithstanding hold true, concerning the upper part of the Air, where there is such a separation of one Body from another; and so consequently, an answerable heat. I answer;

1. 'Tis not generally granted, That motion in all kind of Bodies does produce heat; some restrain it only to solid Bodies; affirming, That in those which are fluid, it is rather the cause of coldness. This is the reason (say they) why running Waters are ever to our sense the coolest: And why amongst those Winds which proceed from the same Coasts of Heaven, about the same time of the Year, the strongest always is the coldest? If you object, that running Waters are not so soon frozen as others: They answer, This is not because they are thereby heated; but because unto congelation, it is requisite that a Body should settle and rest, as well as be cold.

2. If we should grant a moderate heat in those parts of the Air, we have not any experiment to the contrary, nor would it pre-

judice the present Opinion, or common Principles.

Ad 3. As the sound of this Motion is not more heard, than the Harmony of the Heavens: so neither is there any reason why this Motion should cause a sound, more than the supposed Motion of the Heavens, which is likewise thought to be continued unto the Air hard by us.

Ad 4. This will prove the Earth to move as well as the Heavens; For that has, first, a round Figure, as is generally granted. Secondly, Being considered as whole, and in its proper place, it is not heavy, as was proved before: and as for the two other conditions, neither are they true of the Heavens; nor if they were, would they at all conduce to their Motion.

Ad 5. This Argument would prove that the Sea did not ebb and flow, because there is not the same kind of motion in every drop of Water: or that the whole Earth is not spherical, because every little piece of it is not of the same Form.

Ad 6. This is rather an Illustration than a Proof; or if it do prove any thing, it may serve as well for that purpose unto which it is afterward applied, where the motion of every Planet is supposed to depend upon the revolution of the Sun.

Ad 7. That the Sun and Planets do work upon the Earth by their own real daily motion, is the thing in question; and therefore must not be taken for a common Ground.

Ad 8.

Ad 8. We grant, that the Earth is firm and stable from all such motions, whereby it is jogged, or uncertainly shaken.

Ad 9. 1. For the authority of those Divines, which he urges for the interpretation of these Scriptures; this will be but a weak Argument against that Opinion which is already granted to be a Paradox.

2. The Scriptures themselves, in their right meaning, will not at all conduce to the present purpose.

As for that in *Isaiah*, if we consult the coherence, we shall find that the scope of the Prophet, is to set forth the Glory of the Church Triumphant. Wherein (he says) there shall not be any need of the Sun or Moon, but God's presence shall supply them both: *For the Lord shall be unto thee an everlasting Light, and thy God thy Glory, vers. 19.* and as for this Sun and Moon, it shall not go down, or withdraw it self; but he shall be an *Everlasting Light*, without intermission. So that 'tis evident, he speaks of that Light which shall hereafter be, instead of the Sun and Moon.

As for that in the *Revelations*, we yield, that *Time shall cease*; but to say that this depends upon the cessation of the Heavens, is to beg the Question, and to suppose that which is to be proved, viz. that Time is measured by the Motion of the Heavens, and not of the Earth. * *Perricini* (from whom this last Argument was borrowed without acknowledgment) might have told him,

Id. Rev.
21. 3. 6.
tem c. 22.
ver. 5.

Gen. c. 1.
1, 2. quest. 6

him, in the very same place, that Time does not absolutely, and universally depend upon the Motion of the Heavens, *sed in motu & successione cujuslibet durationis*, but in any such succession, by which duration may be measured.

As for that in the *Romans*, we say, that there are other Vanities to which the Heavenly Bodies are subject. As first, unto many changes and alterations, witness those Comets, which at several times have been discerned amongst them; and then likewise to that general corruption, in which all the Creatures shall be involved at the last Day. *When they shall pass away with a great noise, and the Elements shall melt with fervent heat.* 2 Pet. 3.
10, 12.

Thus you see, there is not any such invincible strength in these Arguments, as might cause the Author of them to triumph before-hand with any great noise of victory.

Another Objection like unto these, is taken from the Etymology of several words. Thus the Heavens are called *Aethera*, *ab æt. Sên*, because they are always in motion; and the Earth *Vesta*, *quia vi stat*, because of its immobility.

To which I answer: 'Twere no difficult matter to find such proofs for this opinion, as well as against it.

Thus we may say, that the Hebrew word *עָרָא*, is derived from *עָרָה*, *quia currit*; and *Terra*, *non quod teratur*, *sed quod perenni cursu*

circa omnia terat, faith Calcagnius. However, though we suppose the Etymology to be never so true and genuine, yet it can at the best but shew what the more common opinion was of those times when such names were first imposed.

Ob. But suppose all this were so, That the Earth had such a diurnal Revolution; yet how is it conceivable, that it should at the same time have two distinct Motions.

I answer: This may easily be apprehended, if you consider how both these Motions do tend the same way, from West to East. Thus a Bowl being turned out of the hand, has two Motions in the Air; one, whereby it is carried round; the other, whereby it is cast forward.

From what hath been delivered in this Chapter, the indifferent Reader may gather some satisfaction for those Arguments which are usually urged against this Diurnal Motion of the Earth.

P R O P.

P R O P. IX.

That it is more probable the Earth does move, than the Sun or Heavens.

AMongst those many Arguments that may be urged for the confirmation of this Truth, I shall only set down these five.

1. If we suppose the Earth to be the cause of this Motion, then will those vast and glorious Bodies of the Heavens, be freed from that inconceivable, unnatural swiftness, which must otherwise be attributed unto them.

For if the Diurnal Revolution be in the Heavens, then it will follow, according to the common *Hypothesis*, that each Star in the *Equator*, must in every hour move at the least 4529538 German miles. So that according to the observation of * *Cardan*,
Vid. Mast. Epit. Astr. lib. 1. in fine.
 who tells us, that the Pulse of a well-tempered Man, does beat 4000 times in an hour; one of the Stars in that space, whilst the Pulse beats once, must pass 1132 German miles (faith *Alphraganus*): Or, according to *Tycho*, 732 German miles. But these numbers seem to be somewhat of the least; and therefore many others do much enlarge them, affirming, that every Star in the

* *De Prop. lib. 5. prop. 58.*

the Equator, in one beating of the Pulse, must move 2528 of these miles.

†Commun.
in prim.
cap. Spher.

'Tis the Assertion of †Clavius, that though the distance of the Orbs, and so consequently their swiftness, seem to be altogether incredible; yet it is rather far greater in it self, than Astronomers usually suppose it; and yet (saith he) according to the common Grounds, every Star in the Equator, must move 42398437½ miles in an hour. And though a Man should constantly travel 40 miles a day, yet he would not be able to go so far as a Star does in one hour, under 2904 Years: Or if we will suppose an Arrow to be of the same swiftness, then must it compass this great Globe of Earth and Water 1884 times in an hour. And a Bird that could but fly as fast, might go round the World seven times in that space, whilst one could say, *Ave Maria, gratia plena, Dominus tecum.*

Which though it be a pretty round pace, yet you must conceive that all this is spoken only of the eighth Sphere; and so being compared to the swiftness of the *Primum Mobile*, is but a slow and heavy Motion.

For (saith the same Author) the thickness of each Orb is equal to the distance of its concave Superficies from the Centre of the Earth. Thus the Orb of the Moon does contain as much space in its thickness, as there is betwixt the nearest part of that and the Centre. Thus also the eight Sphere

is

is as thick as that whole space betwixt the Centre of the Earth, and its own concave Superficies. So likewise must it be in those three other Orbs, which he supposes to be above the starry Heaven. Now if we proportion their swiftness according to this difference in their bigness, you may then conceive (if you can) what a kind of celerity that must be, by which the *Primum Mobile* will be whirled about.

Tycho makes the distance of the Stars to be much less, and their motion slower; and yet he is fain to confess, that it is *omni cogitatione celerior*.

Clavius likewise, speaking concerning the swiftness of the Starry Orb, does acknowledge, *Quod velocitas ejus caput humani ingenii excedit*. What then could he think of the *Primum Mobile*?

Dr. Gilbert being (it seems) astonished at the consideration of this strange swiftness, says of it, that it is *motus supra omnes cogitationes, somnia, fabulas, & licentias poeticas insuperabilis, ineffabilis, incomprehensibilis*. A man may more easily conceive the possibility of any Fable or Fiction, how Beasts and Trees might talk together, than how any material Body should be moved with such a swiftness.

Not but that 'tis possible for God to turn them about with a far greater velocity. Nay, 'tis possible for Art to contrive a motion, which shall be equally slow in that proportion as this is swift. But however, the question

De magnitudine lib. 6. cap. 3.

question here is, not what can be done, but what is most likely to be done, according to the usual course of Nature. 'Tis the part of a Philosopher, in the resolution of natural Events, not to fly unto the absolute Power of God, and tell us what he can do, but what, according to the usual way of Providence, is most likely to be done, to find out such causes of things, as may seem most easy and probable to our reason.

If you ask, What repugnancy there is in the Heavens, unto so great a swiftness? We answer; Their being such vast, material condensed Substances, with which this inconceivable Motion cannot agree.

Since Motion and Magnitude are two such Geometrical things, as bear a mutual proportion to one another; therefore it may seem convenient, that slowness should be more agreeable to a great Body, and swiftness to a lesser: and so it would be more consonant to the Principles of Nature, that the Earth, which is of a lesser quantity, should be appointed to such a Motion, as is somewhat proportionable to its bigness, than that the Heavens, that are of such a vast magnitude, should be whirled about with such an incredible swiftness, which does so far exceed the proportion of their bigness, as their bigness does exceed this Earth, that is but as a Point or Centre to them. 'Tis not likely that Nature, in these constant and great Works, should so much deviate from that usual Harmony and Proportion

portion which she observes in lesser Matters. If this Globe of Earth only were appointed to move every day round the Orb of the fixed Stars, though it be but a little Body, and so more capable of a swift motion; yet that swiftness would be so extremely disproportionable unto it, that we could not with reason conceive it possible, according to the usual course of Nature. But now, that the Heavens themselves, of such strange bigness, with so many Stars, which do so far exceed the Magnitude of our Earth, should be able to turn about with the same celerity; Oh! 'tis altogether beyond the fancy of a Poet, or a Madman.

For answer unto this Argument, our Adversaries tell us, that there is not in the Heavens any repugnancy to so swift a Motion; and that whether we consider the nature of those Bodies; or, secondly, the swiftness of this Motion.

1. For the Nature of those } *Qualities.*
Bodies, either their } *Quantity.*

1. There is not in them the Qualities of lightness or heaviness, or any the least contrariety that may make them reluctant to one another.

2. Their Magnitude will help them in their swiftness : For the greater any Body is, the quicker will it be in its motion, and that not only when it is moved by an inward Principle, as a Millstone will descend faster

Ross. lib. 15
f. 28. 1. c. 1.

than a little Pebble ; but also when its Motion does proceed from some external Agent, as the Wind will drive a great Cloud, or a heavy Ship, when it is not able to stir a little Stone.

2. As for the swiftness of this Motion, the possibility of it may be illustrated by other Particulars in Nature : As,

*Idem lib. 2
sect. 1. c. 5.*

1. The sound of a Cannon, in a little time, is carried for twenty miles distance.

2. Though a Star be situate so remotely from us ; yet the Eye discerns it in a moment, which is not without some motion, either of the Species of the Star, or the Rays of the Eye. Thus also the Light does in an instant pass from one side of the Heaven to another.

*Idem lib. 1
sect. 1. c. 2.*

3. If the force of Powder be able to carry a Bullet with so great a swiftness, we need not doubt then, but that the Heavens are capable of such a celerity, as is usually attributed unto them.

Unto these it may be answered :

1. Where they say that the Heavenly Bodies are without all gravity ; we grant it, in the same sense as our Earth also, being considered as whole, and in its proper place, may be denied to be heavy : since this Quality, in the exactest sense, can only be ascribed unto such parts as are severed from the whole to which they belong. But however, since the Heavens, or Stars, are of a material Substance, 'tis impossible but there should be in them some ineptitude to Motion ;

on ; because Matter is of it self a dull and sluggish thing ; and by so much the more, as it is kept close and condensed together. And though the followers of *Ptolomy*, do with much confidence deny the Heavens to be capable of any reluctancy to motion ; yet it were easy to prove the contrary, out of their own Principles. 'Tis not conceivable, how the upper Sphere should move the nether, unless their Superficies were full of rugged parts, (which they deny :) or else one of the Orbs must lean upon the other with its weight, and so make it partake of its own Motion. And besides, they tell us, that the farther any Sphere is distant from the *Primum Mobile*, the less is it hindered by that in its proper course, and the sooner does it finish its own Revolution. From whence it will easily follow, that these Bodies have resistancy from one another.

I have often wondred, why amongst the enchanted Buildings of the Poets, they have not fained any Castle to be made of the same Materials with the solid Orbs, since in such a Fabrick, there would have been these eminent Conveniences.

1. It must needs be very pleasant, by reason of its perspicuity, because it is more diaphanous than the Air it self, and so the Walls of it could not hinder the prospect any way.

2. Being so solid and impenetrable, it must needs be excellent against all violence of Weathers, as also against the assaults of

the Enemy, who should not be able to break it with the most furious Batteries of the Ram, or pierce it with any Cannon-shot.

3. Being void of all heaviness, a Man may carry it up and down with him, as a Snail does his House: and so, whether he follow the Enemy, or fly from him, he has still this advantage, that he may take his Castle and Defence along with him.

But then again, there are on the other side as many inconveniences. For,

1. Its perspicuity would make it so open, that a Man should not be able to retire himself into any private part of it. And then,

2. Being so extremely solid, as well as invisible, a Man should be still in danger of knocking his head against every Wall and Pillar; unless it were also intangible, as some of the *Peripateticks* affirm.

3. Its being without all gravity, would bring this inconvenience, that every little puff of Wind would blow it up and down; since some of the same Sect are not ashamed to say, that the Heavens are so utterly devoid of Heaviness, that if but a little Fly should jostle against the vast Frame of the Celestial Spheres, he would move them out of their places.

A strong Fancy, that could be at leisure, might make excellent sport with this Astronomical Fiction.

So that this first evasion of our Adversaries, will not shelter them from the force of that Argument, which is taken from the incredible swiftness of the Heavens.

2. Whereas they tell us, in the second place, that a bigger Body, as a Millstone, will naturally descend swifter than a less, as a Pebble. I answer: This is not because such a great Body is in it self more easily movable; but because the bigger any thing is which is out of its own place, the stronger will be its natural desire of returning thither, and so consequently the quicker its motion. But now those Bodies that move circularly, are always in their proper situations, and so the same reason is not applicable unto them. And then, whereas 'tis said, that Magnitude does always add to the swiftness of a violent motion, (as Wind will move a great Ship sooner than a little Stone): We answer, This is not because a Ship is more easily movable in it self than a little Stone: For I suppose, the Objector will not think he can throw the one as far as the other, but because these little Bodies are not so liable to that kind of violence, from whence their Motion does proceed.

As for those Instances which are cited to illustrate the possibility of this swiftness in the Heavens, we answer: The passage of a Sound, is but very slow in comparison to the motion of the Heavens. And then besides, the swiftness of the Species of Sound

or Sight, which are Accidents, are not fit to infer the like celerity in a material substance. And so likewise for the Light which
 * *De Ani- * Aristotle himself, and with him the gene-
 mal. 2. c. 7* rality of Philosophers, do for this very reason prove not to be a Body, because it moves with such swiftness, of which (it seems) they thought a Body to be incapable. Nay, the † Objector himself, in another place, speaking of Light in reference to a Substance, does say; *Lumen est accidens, sic species rei visæ, & alia est ratio substantiarum, alia accidentium.*

† *Ross, l. 2.
 scd. 1. c. 4.*

To that of the Bullet, we answer: He might as well have illustrated the swiftness of a Bullet, which will pass four or five miles in two minutes, by the motion of a hand in a Watch, which passes two or three inches in twelve hours; there being a greater disproportion betwixt the motion of the Heavens, and the swiftness of a Bullet, than there is betwixt the swiftness of a Bullet, and the motion of a Hand in a Watch.

Arg. 2. Another Argument to this purpose, may be taken from the chief end of the Diurnal and Annual Motions, which is to distinguish betwixt Night and Day, Winter and Summer; and so consequently, to serve for the Commodities and Seasons of the habitable World. Wherefore it may seem more agreeable to the Wisdom of Providence, for to make the Earth as well the efficient, as the final cause of this motion:

tion: Especially since nature in her other Operations does never use any tedious difficult means, to perform that which may as well be accomplished by shorter and easier ways. But now, the appearances would be the same, in respect of us, if only this little Point of Earth were made the subject of these Motions, as if the vast Frame of the World, with all those Stars of such number and bigness, were moved about it. 'Tis a common Maxim, *μηδὲν ἐῖχῃ τὸ πᾶν φύσιν ἐργάζεσθαι.* Nature does nothing in vain, but in all her courses does take the most compendious way. 'Tis not therefore (I say) likely, that the whole Fabrick of the Heavens, which do so much exceed our Earth in magnitude and perfection, should be put to undergo so great and constant a Work in the service of our Earth, which might more easily save all that labour, by the Circumvolution of its own Body; especially, since the Heavens do not by this motion attain any farther perfection for themselves, but are made thus serviceable to this little Ball of Earth. So that in this case it may seem to argue as much improvidence in Nature to imploy them in this motion, as it would in a * Mother, who in warming her Child, would rather turn the Fire about that, than that about the Fire. Or in a † Cook, who would not roast his Meat, by turning it about to the Fire; but rather, by turning the Fire about it. * Or in a Man, vvho
 † *Lansberg*
 † *Keplar.*
 * *Galile-
 us.*

ascending some high Tower, to save the labour of stirring his Head, should rather desire that all the Regions might successively be turned before his Eye, that so he might easily take a view of them.

We allow every Watch-maker so much wisdom, as not to put any Motion in his Instrument, which is superfluous, or may be supplied an easier way: And shall we not think that Nature has as much providence as every ordinary Mechanick? Or can we imagine that She should appoint those numerous and vast Bodies, the Stars, to compass us with such a swift and restless Motion, so full of confusion and uncertainties, when as all this might as well be done by the Revolution of this little Ball of Earth?

Arg. 3. Amongst the several parts of the World, there are six Planets which are generally granted to move. As for the Sun and the Earth, and the fixed Stars, it is yet in question, which of them are naturally indowed with the same condition. Now common reason will dictate unto us, that Motion is most agreeable to that which in kind and properties is most near to those Bodies that undoubtedly are moved. But now there is one eminent qualification, wherein the Earth does agree with the Planets; whereas the Sun, together with the fixed Stars, do in the same respect differ from them: and that is Light, which all the Planets, and so too the Earth, are said to

to borrow elsewhere, whilst the Sun and the Stars have it of their own. From whence it may be probably concluded, that the Earth is rather the Subject of this Motion than the other. To this it may be added, that the Sun and Stars seem to be of a more excellent Nature than the other parts of the World, and therefore should in reason be endowed with the best qualifications. But now Motion is not so noble a condition as Rest: that is but a kind of wearisome and servile thing, whereas this is usually ascribed to God himself: Of whom 'tis said;

* *Immotus stabilisq; manens dans cuncta moveri.*

* Bott. de
Consol.
Phil. l. 3.

Arg. 4. † Aristotle tells us, 'Tis very agreeable to reason, that the time appointed for the Revolution of each Orb, should be proportionable to its bigness. But now this can only be, by making the Earth a Planet, and the Subject of the Annual and Diurnal Motions. Wherefore 'tis probable, that this does rather move than the Heavens.

† De Caelo,
l. 2. c. 10.

According to the common Hypothesis, the *Primum Mobile* will move round in a day. *Saturn* in thirty Years. *Jupiter* in twelve. *Mars* in two. The *Sun*, *Venus*, and *Mercury*, which have several Orbs, yet will agree in their Revolutions, being each of them about a Year in finishing their Courses: Whereas, by making the Earth a Planet, there will be a just proportion betwixt the bigness

bigness of the Orbs, and the time of their Motions: For then, next to the Sun, or Centre, there will be the Sphere of *Mercury*; which as it is but narrow in its Diameter, so likewise is it quick in its Motion, running its Course in eighty eight days: *Venus*, that is next unto it, in 224 days: The *Earth* in 365 days, or a Year: *Mars* in 687 days: *Jupiter* in 4332 days: *Saturn* in 10759 days. Thus likewise is it with those *Medicean Stars* that encompass *Jupiter*. That which is lowest amongst them, finishes his Course in two and twenty hours; the next in three days and an half; the third in seven days; and the farthest in seventeen days. Now as it is (according to *Aristotle's* confession) more likely that Nature should observe such a due proportion betwixt the Heavenly Orbs; so is it more probable, that the Earth should move, rather than the Heavens.

Arg. 5. This may likewise be confirmed from the appearance of Comets: Concerning which, there are three things commonly granted; or if they were not, might be easily proved: Namely,

1. That there are divers Comets in the Air, betwixt the Moon and our Earth.
2. That many of these Comets do seem to rise and set as the Stars.
3. That this appearing Motion is not properly their own, but communicated unto them from somewhat else.

But

But now, this Motion of theirs cannot be caused by the Heavens; and therefore it must necessarily proceed from the Revolution of our Earth.

That the Moon's Orb cannot carry along with it the greater part of the Air wherein these Comets are placed, might easily be proved from the common Grounds. For the Concave Superficies of that Sphere, is usually supposed to be exactly terse and smooth; so that the meer touch of it cannot turn about the whole Element of Fire, with a Motion that is not natural unto it. Nor could this Elementary Fire, which they imagine to be of a more rarified and subtil Nature, communicate the same Motion to the thicker Air, and that to the Waters (as some affirm): For by what means could that smooth Orb take hold of the adjoining Air? To this *Sarsius* answers, that there are great Gibbosities, and mountainous Inequalities, in the Concavity of the lowest Sphere, and by these is it enabled to carry along with it the Fire and Air. But * *Fromondus* * *Antarist.* tells him, *Fictitia ista, & ad fugam reperta* ^{cap. 16.} *sunt.* And yet his own Conjecture is scarce so good, when he affirms, that this Motion of the Ætherial Air, as also of that Elementary Air hard by us, is caused by that ruggedness which there is in the Bodies of the Planets; of which Opinion, we may, with as good reason, say as he says to *Sarsius*: *Fictitia ista, & ad fugam reperta*; These things are meer Fictions, invented

ted for shifts, and without any probable ground.

But now, this appearance of the Comets may easily be resolved, if we suppose the Earth to move. For then, though they did still remain in their wonted places; yet this, by its Diurnal Revolution, successively withdrawing it self from them, they will appear to rise and set. And therefore, according to this common natural Experiment, it is more probable that the Earth should move, than the Heavens.

Another Argument urged by some, to prove that this Globe of Earth is easily movable, is taken from the Opinion of those who affirm, that the access of any Weight unto a new place, as suppose an Army, does make the Earth poise it self afresh, and change the Centre of Gravity that it had before; but this is not generally granted, and therefore not to be insisted on as a common ground.

To this purpose likewise is that Inference of *Lansbergius*, who from *Archimedes* his saying, that he could move the Earth, if he knew where to stand and fasten his Instrument; concludes, that the Earth is easily movable: whereas it was the intent of *Archimedes*, in that Speech, to shew the infinite power of Engines; there being no Weight so great, but that an Instrument might be invented to move it.

Before we finish this Chapter, 'tis requisite that we enquire what kind of Faculty that

*Vid. Vafq.
l. 1. disp. 2.
cap. 816.*

that is, from which these Motions that *Copernicus* ascribes unto the Earth, does proceed. Whether or no it be some Animal Power that does assist (as *Aristotle*), or inform (as *Keplar* thinks), or else some other natural motive Quality which is intrinical unto it.

We may observe, That when the proper genuine cause of any Motion is not obvious, Men are very prone to attribute unto that which they discern to be the most frequent Original of it in other things, Life. Thus the *Stoicks* affirm, the Soul of the Water to be the cause of the ebbing and flowing of the Sea. Thus others think the Wind to proceed from the Life of the Air, whereby it is able to move it self several ways, as other living Creatures. And upon the same grounds do the *Platonicks*, *Stoicks*, and some of the *Peripateticks*, affirm the Heavens to be animated. From hence likewise it is, that so many do maintain *Aristotle* his Opinion concerning *Intelligences*: which some of his Followers, the School-men, do confirm out of Scripture; from that place in *Matth. 24. 29.* where 'tis said, *The Powers of the Heavens shall be shaken.* In which words, by *Powers*, (say they) are meant the Angels, by whose power it is that the Heavens are moved. And so likewise in that, *Job 9. 13.* where the Vulgar has it, *Sub quib. curvantur, qui portant orbem*; that is, the *Intelligences*. Which Text, might serve altogether as well to prove the Fable of

*Sen. Nat.
Qu. lib. 5.
cap. 5, 6.*

Atlas

Atlas and Hercules. Thus *Cajetan* concludes from that place in *Psalms* 136. 5. where 'tis said, *God by wisdom made the Heavens*: or, according to the Vulgar, *Qui fecit Caelos intellectu*, That the Heavens are moved by an intelligent Soul.

If we consider the Original of this Opinion, we shall find it to proceed from that mistake of *Aristotle*, who thought the Heavens to be Eternal; and therefore to require such a moving cause, as being of an immaterial Substance, might be exempted from all that weariness and inconstancy, which other things are liable unto.

But now this ground of his is evidently false, since 'tis certain, That the Heavens had a beginning, and shall have an end. However, the employing of Angels in these Motions of the World, is both superfluous and very improbable.

1. Because a natural Power, intrinsic to those Bodies, will serve the turn as well. And as for other Operations, which are to be constant and regular, Nature does commonly make use of some inward Principle.

2. The *Intelligences* being immaterial, cannot immediately work upon a Body. Nor does any one tell us what Instruments they should make use of in this business. They have not any hands to take hold of the Heavens, or turn them about. And that Opinion of *Aquinas*, *Durand*, *Socinus*, with other

other School-men, seems to be without all reason; who make the Faculty, whereby the Angels move the Orbs, to be the very same with their Understandings and Will: So that if an Angel do but merely suspend the Act of willing their Motion, they must necessarily stand still; and on the contrary, his only willing them to move, shall be enough to carry them about in their several Courses. Since it were then a needless thing for Providence to have appointed Angels unto this business, which might have been done as well by the only Will of God. And besides, how are the Orbs capable of perceiving this Will in the Intelligences? Or if they were, yet what motive Faculty have they of themselves, which can inable them to obey it?

Now, as it would be with the Heavens; so likewise is it with the Earth, which may be turned about in its Diurnal Revolution, without the help of Intelligences, by some motive Power of its own, that may be intrinsic unto it.

If it be yet inquired, What cause there is of its Annual Motion? I answer: 'Tis easily conceivable, how the same Principle may serve for both these, since they tend the same way, from West to East.

However, that Opinion of *Keplar* is not very improbable, That all the Primary Planets are moved round by the Sun, which once in twenty five, or twenty six days,

days, does observe a Revolution about its own Axis, and so carry along the Planets that encompass it; which Planets are therefore slower or swifter, according to their distances from him.

If you ask, By what means the Sun can produce such a Motion?

He answers: By sending forth a kind of Magnetick Virtue in streight Lines, from each part of its Body; of which there is always a constant succession: so that as soon as one Beam of this Vigor has passed a Planet, there is another presently takes hold of it, like the Teeth of a Wheel.

But how can any Virtue hold out to such a distance?

He answers: First, as Light and Heat, together with those other secret Influences, which work upon Minerals in the Bowels of the Earth: so likewise may the Sun send forth a Magnetick Motive Virtue, whose Power may be continued to the farthest Planets.

Secondly. If the Moon, according to common Philosophy, may move the Sea, why then may not the Sun move this Globe of Earth?

In such Queries as these, we can conclude only from Conjectures, that Speech of the Wise Man, *Eccles. 3. 11.* being more especially verified of Astronomical Questions, concerning the Frame of the whole Universe, *That no Man can find out the Works of God,*

God, from the beginning to the end. Though we may discern divers things in the World, which may argue the infinite Wisdom and Power of the Author; yet there will be always some Particulars left for our dispute and enquiry, and we shall never be able, with all our industry, to attain a perfect comprehension of the Creatures, or to find them wholly out, *from the beginning to the end.*

The Providence of God having thus contrived it, that so Man might look for another Life after this, when all his longing and thirst shall be fully satisfied. For since no natural Appetite is in vain, it must necessarily follow, that there is a possibility of attaining so much knowledg, as shall be commensurate unto those desires; which because it is not to be had in this World, it will behove us then to expect and provide for another.

*Vallef.
Sacr. Pbi-
log. c. 64.*

M

PROP.

P R O P. X.

That this Hypothesis is exactly agreeable to common appearances.

IT hath been already proved, that the Earth is capable of such a situation and motion, as this Opinion supposes it to have. It remains, that in the last place, we shew how agreeable this would be unto those ordinary seasons of Days, Months, Years, and all other appearances in the Heavens.

1. As for the difference betwixt Days and Nights: 'tis evident, That this may be caused as well by the Revolution of the Earth, as the Motion of the Sun; since the Heavenly Bodies must needs seem after the same manner to Rise and Set, whether or no they themselves by their own Motion do pass by our *Horizon* and *Vertical Point*; or whether our *Horizon* and *Vertical Point*, by the Revolution of our Earth, do pass by them. According to that of * *Aristotle*, *ἔστιν διάφορον πρὸς τὴν ὁψιν ἢ τὸ ὁρώμενον*. There will not appear any difference; whether or no the Eye be moved from the Object, or the Object from the Eye. And therefore I cannot chuse but wonder that a Man of any Reason

* *De Caelo*,
lib. 2. c. 8.

or

or Sense should make choice of no better an Argument to conclude his Book withal, than that which we read at the latter end of *Al. Ross.* where he infers, that the Earth does not move, because then the shadow in a Sundial would not be altered.

2. As for the difference of Months, we say, That the divers Illuminations of the Moon, the different bigness of her Body, her remaining for a longer or shorter time in the Earth's shadow, when she is eclipsed, &c. may well enough be solved by supposing her to move above our Earth, in an Eccentric Epicycle. Thus,

In which kind of *Hypothesis* there will be a double difference of Motion. The one caused by the different scituation of the Moon's Body in its own Eccentrick. The other by the different scituation of the Moons Orb in the Earth's Eccentrick: which is so exactly answerable to the Motions and Appearances of this Planet, that from hence *Lansbergius* draws an Argument for this *System* of the Heavens, which in the strength of his confidence he calls, *Demonstrationem Græcè: καὶ οὐκ ἔστιν, cui nullā ratione potest contradici.*

4. As for the difference betwixt Winter and Summer; betwixt the number and length of Days, which appertain to each of those Seasons: the seeming motion of the Sun from one Sign to another in the *Zodiack*: All this may easily be solved, by supposing the Earth to move in an Eccentrickal Orb about the Sun. Thus,

Suppose the Earth to be at C, then the Sun at A, will seem to be in the Sign ♈, and at the greatest distance from us, because the Earth is then in the farthest parts of its *Eccentrick*. When after, by its Annual Motion, it hath passed successively by the Signs ♋ ♌ ♎ ♏, at length it comes to the other *Solstice* at B, where the Sun will appear in ♐, and seem biggest, as being in its *Perigie*, because our Earth is then in the nearest part of its *Eccentrick*.

As for all other Appearances of the Sun, which concern the Annual Motion, you may see by the following Figure, that they are exactly agreeable to this *Hypothesis*.

Where you have the Earth described about the
M 3 the

the Sun at A, in the four chief Points, of the *Zodiack*; namely, the two *Equinoctials* at γ and ϵ , and the *Solstices* at ν and π . Through all which Points, the Earth does pass in its Annual Motion, from West to East.

The *Axis*, upon which our Earth does move, is represented by the Line B C; which *Axis* does always decline from that of the *Ecliptick*, about 23 degrees, 30 minutes. The Points B C, are imagined to be the Poles, B the North Pole, and C the South.

Now if we suppose this Earth to turn about its own *Axis*, by a Diurnal Motion, then every Point of it will describe a Parallel Circle, which will be either bigger or lesser, according to its distance from the Poles. The chief of them are the *Equinoctial* D E. The two *Tropicks*, F G, and H I. The two *Polar Circles*, M N the *Artick*, and K L the *Antartick*: of which, the *Equinoctial* only is a great Circle, and therefore will always be equally divided by the Line of Illumination, M L; whereas the other Parallels are thereby distributed into unequal parts. Amongst which parts, the Diurnal Arches of those that are towards B, the North Pole, are bigger than the Nocturnal, when our Earth is in ν , and the Sun appears in ϵ . Inasmuch, that the whole *Artick Circle* is enlightned, and there is day for half a Year together under that Pole.

Now when the Earth proceeds to the other *Solstice* at π , and the Sun appears in γ , then that

that *Hemisphere* must be involved in darkness, which did before partake of Light. And those Parallels towards the North and South Poles, will still be divided by the same inequality. But those bigger parts, which were before enlightned, will now be darkned, & *vice versa*. As when the Earth was in N, the *Artick Circle* M N was wholly enlightned, and the *Antartick* K L altogether in the dark. So now, when it is in A, the *Antartick* K L, will be wholly in the Light, and the other M N, altogether obscured. Whereas the Sun before was vertical to the Inhabitants at the *Tropick* F G. So now is he in the same situation to those that live under the other *Tropick* H I. And whereas before the Pole did incline 23 degrees 30 minutes towards the Sun, so now does it recline as much from him. The whole difference will amount to 47 degrees, which is the distance of one *Tropick* from the other.

But now, in the two other Figures, when the Earth is in either of the *Equinoctials* γ ϵ , the Circle of Illumination will pass through both the Poles; and therefore must divide all the Parallels into equal parts. From whence it will follow, that the Day and Night must then be equal in all places of the World.

As the Earth is here represented in ϵ , it turns only the enlightned part towards us; as it is in γ , we see its *Nocturnal Hemisphere*.

So that according to this *Hypothesis*, we may easily and exactly reconcile every Ap-

pearance concerning the difference betwixt Days and Nights, Winter and Summer, together with all those other varieties which depend upon them.

If you would know how the Planets (according to the *Systeme* of the Heavens) will appear *Direct*, *Stationary*, *Retrograde*; and yet still move regularly about their own Centres, you may plainly discern it by this following *Diagram*.

Where

Where suppose the Sun to be at A, the Circle (B G M) to be the Orb of the Earth's Motion; and that above it, noted with the same Letters, to be the Sphere of *Jupiter*; and the uppermost of all, to be a part of the *Zodiack*, in the Starry Heaven.

Now if you conceive the Letters, B C D E F G H I K L M, and a b c d e f g h i k l m, to divide the Earth's Orb, and that of *Jupiter*, into several parts, proportionable to the slowness or swiftness of their different motions, (*Jupiter* finishing his Course in twelve Years, and the Earth in One) then supposing the Earth to be at the Point (B), and *Jupiter* likewise in his Orb to be situated at (b), he will appear unto us to be in the *Zodiack* at the point (r). But afterwards, both of them moving forward to the Letter (C c), *Jupiter* will seem to be in the *Zodiack* at (v), as having passed directly forward according to the order of the Signs. And so likewise each of them being transferred to the places (D d) (E e), *Jupiter* will still appear *Direct*, and to have moved in the *Zodiack* unto the Points (y z). But now when the Earth comes to be more immediately interposed betwixt this Planet and the Sun; as when both of them are at the Letter (F f), then will *Jupiter* be discerned in the *Zodiack* at (x). So that all the while the Earth was passing the Arch (E F), *Jupiter* did still remain betwixt the Points (z) and (x), and therefore must seem unto us as if he were *Stationary*; but after-

afterwards, both of them being carried to (G.g), then *Jupiter* will appear at (s), as if by a hasty motion he had returned from his former Course the space (x.s): Both of them passing to (H.h), this Planet will still seem to be swiftly *Retrograde*, and appear in the Point at (p); but when they come to the Points (I.i), *Jupiter* will then seem to be slower in this Motion, and to have only passed the space (p.n). Both of them being transferred to (K.k), *Jupiter* will then appear in the *Zodiack* at (o), as being again *Direct*, going forward according to the order of the Signs; and while the Earth did pass the Arch (I.K), *Jupiter* then remain'd between the Points (n.o), and so consequently, did again seem to be *Stationary*. Both of them coming to (L.l), and thence to (M.m), *Jupiter* will still appear *Direct*, and to have gone forward in the *Zodiack* from (q) to (t). So that all the space wherein *Jupiter* is *Retrograde*, is represented by the Arch (n.z). In which space, he himself moves in his own Orb, the Arch (e.i), and so the Earth in its Orb, a proportional space (E.I).

As it hath been said of this Planet, so likewise is it applicable to the other. *Saturn*, *Mars*, *Venus*, *Mercury*; all which are thus made to appear *direct*, *stationary*, and *retrograde*, by the motion of our Earth, without the help of those *Epycles* and *Eccentrics*, and such unnecessary Wheel-work, wherewith *Ptolomy* hath filled the Heavens.

In-

Inasmuch that here * *Fromondus* is fain to confess, *Nullo Argumento in speciem probabiliore, motum terra annuum a Copernicani astrui, quam illo stationis, directionis, regressionis Planitarum.* There is not any more probable Argument to prove the Annual Motion of the Earth, than its agreeableness to the *station*, *direction*, and *regression* of the Planets.

Lastly, That *Copernicus's* System of the Heavens, is very answerable to the exactest Observations, may be manifest from this following description of it.

Suppose

* *Antarist.*
cap. 18.
Vest. tract.
4. cap. 3.

Suppose the Sun to be scituated at A. Now because *Mercury* is found by experience to be always very near the Sun, so that he does for the most part lie hid under his Rays. As also because this Planet hath a more lively vigorous Light than any of the other; therefore we may infer, that his Orb is placed next unto the Sun, as that at B.

As for *Venus*, 'tis observed, That She does always keep at a set distance from the Sun, never going from him above forty degrees, or thereabouts; that her Body appears, through the Perspective, to be forty times bigger at one time than at another; that when she seems biggest and nearest unto us, we then discern her as being perfectly round. Therefore doth this Planet also move in a Circle that incompasseth the Sun: Which Circle does not contain the Earth within it, because then, *Venus* would sometimes be in *opposition* to the Sun; whereas, 'tis generally granted, that she never yet came so far as to be in a *Sextile*.

Nor is this Circle below the Sun, (as *Pto-*

† *Matutina*, *Vesper-*
ina.

lomy supposeth) because then this Planet, in both its Conjunctions, would appear horned, which she does not.

Nor is it above the Sun, because then she would always appear in the Full, and never horned.

From hence it will follow, that this Orb must necessarily be betwixt the Earth and the Sun, as that at C.

As for *Mars*, 'tis observed, That he does appear

appear sixty times bigger when he is near us, than at his greatest distance; that he is sometimes in *opposition* to the Sun. From whence we may conclude, that his Orb does contain our Earth within it. 'Tis observed also, that he does constantly appear in the Full, and never horned; from whence likewise it is manifest, that the Sun is comprehended within its Orb, as it is in that which is represented by the Circle E.

And because the like appearances are observed in *Jupiter* and *Saturn*, (though in less degrees) therefore we may with good reason conceive them to be in the Heavens, after some such manner as they are here set down in the Figure, by the Circles F G.

As for the Moon; because she is sometimes in *opposition* to the Sun; therefore must her Orb comprehend in it the Earth; because she appears dark in her Conjunction, and sometimes eclipses the Sun, therefore that must necessarily be without her Orb, as it is in that *Epicycle* at H. In the Centre of which, the Earth must necessarily be scituated according to all those appearances mentioned before. So that the Orb of its annual Motion, will be represented by the Circle D.

All which appearances, cannot so well be reconciled by *Ptolemy*, *Tycho*, *Origanus*, or by any other *Hypothesis*, as by this of *Copernicus*. But the application of these to the several Planets, together with sundry other particulars, concerning the *Theo-*
rical

rical part of *Astronomy*, you may see more fully set down by those who have purposely handled this Subject, *Copernicus*, *Rheticus*, *Galilæus*; but more especially *Keplar*, unto whom I do acknowledg my self indebted for sundry Particulars in this Discourse.

I have done with that which was the chief purpose of the present Treatise; namely, the removal of those common Prejudices that Men usually entertain against this Opinion. It remains, that by way of Conclusion, I endeavour to stir up others unto these kind of Studies, which by most Men are so much neglected.

'Tis the most rational way, in the prosecution of several Objects, to proportion our love and endeavour after every thing, according to the excellency and desirableness of it. But now, amongst all Earthly Contentments, there is nothing either better in it self, or more convenient for us, than this kind of Learning; and that, whether you consider it according to its general Nature, as a *Science*; or according to its more special Nature, as, *such a Science*.

1. Consider it as a *Science*. Certain it is, that amongst the variety of Objects, those are more eligible, which conduce unto the welfare of that which is our best part, our Souls. 'Tis not so much the pleasing of our Senses, or the increasing of our Fortunes, that does deserve our industry, as the information of our Judgments, the improvement of our Knowledg. Whatever the

the World may think, yet it is not a vast Estate, a Noble Birth, an eminent place, that can add any thing to our true real Worth; but it must be the degrees of that which makes us *Men*, that must make us *better Men*, the endowments of our Soul, the enlargement of our Reason. Were it not for the contemplation of Philosophy, the Heathen * *Senecca* would not so much as thank the Gods for his Being; *Nisi ad hoc* * *Præf. ad lib. 1. Nat. admitterer non fuit opere pretium nasci. De Quæst. trabe hec inestimabile bonum, non est vita tanti, ut sudem, ut astuem.* Take but away this benefit, and he would not think Life worth the sweating for. So much happiness could he discern in the Studies of Nature. And therefore as a *Science* in general, it may very well deserve our Love and Industry.

2. Consider it as such a particular *Science*, *Astronomy*: The word signifies, the Law of the Stars; and the Hebrews (who do not ordinarily admit of composition) call it, in two words, *חקוקי שמים*, *Cælorum statuta*, or the *Ordinances of Heaven*; because they are governed in their Courses by a certain Rule, as the *Psalmist* speaks, in *Psal. 148. 6. God has given them a Law which shall not be broken.* Job 38. 53.
Jer. 33. 25.

Now this, of all other natural *Sciences*, may best of all challenge our Industry; and that, whether you consider it,

1. Absolutely, as it is in it self: Or,
2. As it stands in reference to us.

1. As

1. As it is in it self. The excellency of any Science may be judged of (saith the Philosopher) first, by the excellency of the Object. Secondly, By the certainty of its Demonstrations.

(1.) For the Object. It is no less than the whole World (since our Earth also is one of the Planets) more especially those vast and glorious Bodies of the Heavens. So that in this respect, it far exceeds all those barren, empty Speculations, about *Materia Prima*, or *Universale*, and such-like Cobwebs of Learning; in the study of which, so many do misplace their younger Years. And for the same reason likewise is it to be prefer'd before all those other Sciences, whose Subjects are not either of so wide an extent, or so excellent a Nature.

(2.) From the Demonstrations of Astronomy, they are as infallible as Truth it self; and for this reason also does it excel all other Knowledg, which does more depend upon Conjectures and Uncertainty. They are only those who want skill in the Principles of this Science, that mistrust the Conclusions of it. Since therefore in these respects, it is one of the most excellent Sciences in Nature, it may best deserve the industry of Man, who is one of the best Works of Nature. Other Creatures were made with their Heads and Eyes turned downwards: Would you know why Man was not created so too? Why it was, that he might be an Astronomer.

*Os homini sublime dedit, Celumq; tueri
Jussit, & erectos ad Sydera tollere vultus.*

*God gave to Man an upright Face, that he
Might view the Stars, and learn Astronomy.*

2. Consider it in reference to us, and so it is;

1. Most Useful.

2. Most Pleasant.

1. Most Useful, and that in sundry respects. It proves a God and a Providence, and incites our Hearts to a greater admiration and fear of his Omnipotency. *We may understand by the Heavens, how much mightier he is that made them; for by the greatness and beauty of the Creatures, proportionably the Maker of them is seen,* saith the Book of Wisdom, Ch. i 3, 4, 5. 'Twas hence Aristotle fetch'd his chief Argument to prove a *primus Motor*. 'Twas the consideration of these things that first led Men to the Knowledg and Worship of God, (saith *Tully); *Hac nos primum ad Deorum cultum, tum ad modestiam, magnitudinemq; animi erudit.* And therefore when God by the Prophet, would convince the People of his Deity, he bids them *lift up their Eyes on high; and behold who hath created those things, that bringeth out their Host by Number, that calleth them all by their Names, &c.* Isa. 40. 26. Which occasioned that saying of *Lastantius*; *Tanta rerum magnitudo, tanta dispositio, tanta infinitas in servandis ordinibus, temporibusq; constantia,* c. 5.

*Tuscul. i
Item Plur.
de Placit.
Phil. l. i.

non potuit aut olim sine provido artifice oriri, aut constare tot seculis sine incola potente, aut perpetuum gubernari sine perito & sciente rectore, quod ratio ipsa declarat. Such a great order and constancy amongst those vast Bodies, could not at first be made, but by a wise Providence, nor since preserved without a powerful Inhabitant; nor so perpetually governed without a skilful Guide.

True indeed, an ordinary view, and common apprehension of these Celestial Bodies, must needs manifest the Excellency and Omnipotency of their Maker; but yet a more accurate and diligent enquiry into their Natures, will raise our Understandings unto a nearer Knowledge, and greater Admiration of the Deity. As it is in those inferior things, where the meer out-side of a Man, the comeliness and majesty of his Countenance, may be some Argument from whence to infer the excellency of his Creator. But yet the subtil Anatomist, who searches more deeply into this wonderful Structure. may see a clearer evidence for this, in the consideration of the inward Fabrick, the Muscles, Nerves, Membranes; together with all those secret Contrivances in the Frame of this little World. Thus also is it in the great *Universe*, where the common apprehension of things is not at all considerable, in comparison to those other Discoveries, which may be found out by a more exact enquiry.

As this Knowledg may conduce to the
proving

proving of a God, and making Men religious; so likewise may it serve to confirm unto us the Truth of the Holy Scriptures; since the Sacred Story, in the order of its Narrations, does so exactly agree with the Conversions of Heaven, and *Logistical Astronomy*.

It may also stir us up to behave our selves answerably, unto the noble and divine Nature of our Souls. *When I consider the Heaven, the Works of thy Fingers; the Moon and the Stars which thou hast ordained, What is Man, that thou art so mindful of him?* *as to* Psal. 8. 3, 6
create such vast glorious Bodies for his Service.

Again, when I consider with my self, the strange immensity, and bigness of this great *Universe*; in comparison to which, this Earth of ours, is but as an undiscernable Point: When I consider that I carry a Soul about me, of a far greater worth than all this, and Desires that are of a wider extent, and more unbounded capacity, than this whole Frame of Nature; then me-thinks it must needs argue a degenerateness and poverty of Spirit, to busy my Faculties about so ignoble, narrow a Subject, as any of these earthly things.

What a folly is it in Men to have such high conceits of themselves, for some small Possessions which they have in the World above others, to keep so great a bussle about so poor a Matter. *Hoc est punctum*

Sen. Nat. *quod inter tot gentes ferro & igni dividitur.*
Quæst. l. 1. 'Tis but a little Point, which with so much
Nonne d. ado is distributed unto so many Nations
terrena a. by Fire and Sword. What great matter is
nimalia it to be a Monarch of a small part of a Point?
considera- Might not the Ants as well divide a little
tu, quibus Mole-hill into divers Provinces, and keep as
præsidere great a stir in disposing of their Govern-
videami- ment? *Punctum est illud in quo Navigatis, in*
si inter quo Bellatis, in quo Regna disponitis. All this
murus vi- place wherein we War, and Travel, and
rum ali- dispose of Kingdoms; is but a Point far less
quod, ju- than any of those small Stars, that at this
sibi ac po- distance are scarce discernable. Which when
testatem the Soul does seriously meditate upon, it

tem, quan- for it self a Mansion in those wider Spaces
to movere- above, such as may be more agreeable to the
vis cha- Nobleness and Divinity of its Nature.
chinos,
&c.
Boëtius de
Consol. l. 2.

Why should any one dream of propaga-
 ting his Name, or spreading his Report
 through the World? when as though he had
 more Glory than Ambition can hope for;
 yet as long as all this habitable Earth is but
 an inconsiderable Point, what great matter
 can there be in that Fame which is included
 within such strait contracted Limits?

Boëtius
ibid.

Quicumq; solam mente præcipiti petit
Summumq; credit gloriam,
Late patentes ætheris cernat plagas,
Arctumq; terrarum situm.

Brevem

Brevem replere non valentis ambitum,
Pudebit aucti nominis.

He that to Honour only seeks to mount,
 And that his chiefest end doth count;
 Let him behold the largeness of the Skies,
 And on the strait Earth cast his Eyes;
 He will despise the glory of his Name,
 Which cannot fill so small a Frame.

Why should any one be taken up in the
 admiration of these lower out-sides, these
 earthly Glories? *Respicite Cæli spatium, fir-* *Idem l. 3.*
mitudinem, celeritatem, & aliquando desinite
vilia mirari. He that rightly understands
 the Nature of the Heavens, will scarce e-
 steem any other thing worth his notice, much
 less his wonder.

Now when we lay all this together, that
 he who hath most in the World, hath almost
 nothing of it; That the Earth it self, in
 comparison to the *Universe*, is but an incon-
 siderable Point: And yet that this whole
Universe does not bear so great proportion
 to the Soul of Man, as the Earth does unto
 that: I say, when a Man, in some retired
 thoughts, shall lay all this together, it must
 needs stir up his Spirits to a contempt of
 these earthly Things, and make him place
 his love, and endeavour upon those Com-
 forts that may be more answerable to the
 excellency of his Nature.

Without this Science, what Traffick could
 we have with Forreign Nations? What
 would

would become of that mutual Commerce, whereby the World is now made but as one Common-wealth.

*Vosq; mediis in aquis Stella, pelagoq; timendo,
Decretum monstratis iter, totiq; dedistis,
Legibus inventis hominum, commercia mundo.*

*'Tis you bright Stars, that in the fearful Sea
Does guide the Pilot through his purpos'd way.
'Tis your direction that doth Commerce give,
With all those Men that thro' the World do live.*

2. As this Science is thus profitable in these and many other respects: so likewise is it equally pleasant. The Eye (saith the Philosopher.) is the sense of Pleasure, and there are no delights so pure and immaterial, as those which enter through that Organ. Now to the Understanding, which is the Eye of the Soul; there cannot be any fairer prospect, than to view the whole Frame of Nature, the Fabrick of this great Universe; to discern that order and comeliness which there is in the magnitude, situation, motion of the several parts that belong unto it; to see the true cause of that constant variety and alteration which there is in the different Seasons of the Year. All which must needs enter into a Man's thoughts, with a great deal of sweetness and complacency. And therefore it was that *Julius Caesar*, in the Broils and Tumult of the Camp, made choice of his delight:

Media

Wisd. 7.
8, 19.

*Media inter praelia semper,
Stellarum, Cœliq; plagis, superisq; vacavit.*

Lucan.
l. 10.

*He always leisure found, amidst his Wars,
To mark the Coasts of Heav'n, & learn the Stars.*

And for this reason likewise did *Seneca*, amidst the continual noise and bustle of the Court, betake himself to this Recreation:

*O quam juvabat, quo nihil majus, parens
Natura gemit, operis immensi artifex,
Cælum inneri Solis, & curros sacros
Mundi; motus, Solis alternas vices,
Orbemq; Phœbes, Astra quem cingunt vaga
Lateq; fulgens ætheris magni decus.*

*O what a pleasure was it to survey
Nature's chief Work, the Heavens; where we may
View the alternate Courses of the Sun,
The sacred Chariots, how the World does run;
The Moon's bright Orb, when she's attended by
Those scattered Stars, whose light adorns the Sky.*

And certainly those eminent Men, who have this way bestowed a great part of their imploiment, such as were *Ptolomy*, *Julius Caesar*, *Alphonsus* King of Spain, the Noble *Tycho*, &c. have not only by this means pitched upon that which for the present was a more solid kind of pleasure and contentment, but also a surer way to propagate their memories unto future Ages. Those great costly

Pyra-

Pyramids which were built to perpetuate the memory of their Founders, shall sooner perish and moulder away into their Primitive Dust, than the Names of such Worthies shall be forgotten. The Monuments of Learning are more durable than the Monuments of Wealth or Power.

All which Encouragements may be abundantly enough to stir up any considering Man, to bestow some part of his time in the study and inquisition of these Truths.

*Fælices animæ, quibus hæc cognoscere primum,
Inq; domos superas scandere cura fuit.*
